## Reliance - a specialist engineering company

Welcome to Reliance. We are a specialist engineering company, unique in our offering of catalogue products and fully bespoke solutions.

Our product catalogue provides a one-stop-shop for the design engineer – from basic essentials, such as captive screws, to complete sub-assemblies for rotary and linear motion. We offer a carefully selected mix of in-house designed and manufactured products together with products from leading

global manufacturers, all of which can be modified to suit individual requirements. We are able to provide design support at the early stages of new product development to create complete prototyping solutions and cost-effective integrated assemblies for full production requirements.

As well as providing catalogue products we have extensive design, development, manufacturing, assembly and test facilities in the UK and Ireland, recently enhanced by a £6million investment programme. From here we offer turnkey technical services for customers requiring bespoke components, assemblies, and systems, not only helping bring new products to market, but also resolving technical problems and extending the life of established products.

Our aim is to provide choice and flexibility for our customers. From standard ex-stock components to custom-designed and manufactured sub-systems or even complete instruments.

Wherever your starting point is with Reliance you should expect technical excellence, high quality solutions and our total commitment to the success of your project.

Andrew Dight.

Managing Director

Introduction to Reliance

## Reliance - established in diverse, global markets

We are an accredited supplier to global OEMs and product developers, covering a wide variety of markets and applications.

In Switzerland our tubular round racks provide a space-saving solution for laboratory automation, locating fluid tubes and fibre optic cables inside the rack to give a more compact instrument. In the UK

over 5,000 syringe drive mechanisms, using our motors and leadscrews, are in operation in drug dispensing systems. In Asia our precision antibacklash gears are used in military applications where our innovative, two-piece gear design is ideal for high reliability applications.

Our gears and leadscrews provide motorised actuation for the fingers and thumb of the *bebionic* prosthetic hand. This is a demanding application requiring high efficiency, high gripping force and low noise, to be achieved under tight space and weight constraints in order to give the patient the necessary dexterity, strength and practical wearability.

Our appetite for problem-solving and for providing creative technical solutions, underpinned by a culture of strong teamwork, has led to long-standing relationships built on close technical, operational and commercial co-operation. An enquiry for a standard catalogue gear was the first step in our journey with RSL Steeper, developers of the prosthetic hand. As we began to develop an understanding of the hand at a complete product level a design engineering relationship began which has strengthened year-onyear.

"We appreciate it's a total team effort to deliver a project, it's a pleasure to work with a company so well co-ordinated who keep us informed all the way through."

RSL Steeper

## SC21 Supply Chain

Providing solutions for diverse markets

## Reliance – helping you make an informed choice

As an engineering company it is important to us to build a thorough understanding of your wider system design and application in order to recommend the most appropriate product. We consider not only the technical specification, but also the product's suitability to the operational environment and any implications of technical and commercial trade-offs.

Discussion of the technical, operational and commercial requirements are a key part of our product support philosophy. Our aim is to help you make an informed choice about our products before you make a purchasing decision; we want to be confident that what we deliver is going to work for you.

Underpinning our engineering knowledge is a sustained investment in test development facilities, which provide an in-depth understanding of the capabilities of our catalogue products. In discussing their suitability for your application we are able to draw upon our test data and experience of designing and supplying components and assemblies into a diverse range of markets.

As a manufacturer we are able to provide a high level of versatility in our range with extensive modifications available. In our precision gears range we offer, for example, options in materials, gear quality, bore diameters, face widths and an extensive choice of teeth cut to order in short lead-times. Our manufacturing capability also helps provide insight into the fitness-for-purpose of the products, based on an understanding of the manufacturing methods used, quality control, surface finish, accuracies and other key criteria which ultimately impact on the performance of your product.

You can contact us by telephone, email or via our website. Alternatively we are happy to arrange a visit to your premises, which has often proved to be an efficient, effective route to understanding the wider aspects of your design programme and providing the appropriate support.

## Precise motion control solutions

The Reliance catalogue provides a one-stop-shop - from components and assemblies for rotary and linear motion to intelligent control and actuation products. Each product is offered with a refined, considered range of options and associated products, such as circlips and screws, all of which have been engineered to interface correctly.

To help design engineers develop prototypes quickly and effectively, we are able to supply small quantities at stock prices, whilst our manufacturing facilities enable larger quantities to be supplied for full production requirements, available with scheduled delivery, consignment stocking and stock management services.

Our catalogue products can be readily modified to support applications which require a tailored solution. If you are not sure whether we offer the specification you need for any of the products in this catalogue then please contact us and we will endeavour to find a solution.

For design engineers seeking integrated solutions, we are able to combine catalogue products and assemblies to provide cost-effective sub-systems. Should a fully bespoke solution be required, further in-depth design engineering support can also be provided which, together with specialist manufacturing, assembly and test facilities, enables production of a wide range of custom-designed electro-mechanical, opto-mechanical, clean and high-vacuum solutions.

The following pages give an overview of the range of products available in the catalogue, shown in the context of both rotary and linear motion systems. We have also provided case study examples of how the catalogue products, together with engineering, manufacturing, assembly and test support, have been used to provide integrated solutions. Highlights of some of our custom design and manufacturing capabilities are also shown on pages 1-12 to 1-15.

## A complete motion control solution

This cost-effective miniature servo system combines a precision stepper motor and high resolution encoder with sophisticated drive and control electronics in a single, compact unit.

- NEMA sizes 11, 17 and 23 each with two frame lengths
- Encoder resolution of 50,000 counts per revolution
- Speeds from 0 to 3,000 RPM
- Continuous torques from 0.027 to 0.87 Nm (1.24 Nm peak)
- H-infinity controller and vector drive for fully closed loop control of position, speed and torque. Tuning not required in most applications.
- Fully programmable for standalone operation
- RS232 and USB communications as standard
- Options for RS485 and Ethernet
- Digital and analogue input and output
- Safe and efficient 24V DC operation

Compared with an equivalent size of stepper motor Cool Muscle works faster, with more available torque, it is more efficient and generates less heat.

Closed loop control means no step loss. In an open loop system it is possible for the motor to fail to move the exact number of steps if it is overloaded. Cool Muscle, being a closed loop control system, is able to identify any potential for step loss and to correct it.

Cool Muscle is available with two types of control interface: Pulse Type (P) and Computer Type (C). The P-Type is applicable for a drive and stepper system with step-pulse control, such as a PLC. Cool Muscle provides an effective drop-in solution to resolve step loss problems and also provides a more integrated solution, having a combined stepper and drive. The C-Type offers a higher level of computer control in a single integrated unit which can remove the need for a separate controller or, in more complex systems, reduce the investment required in additional controllers.

Contact us for product information, design support and custom solutions sales@reliance.co.uk +44 (0) 1484 601002 www.reliance.co.uk

Cool Muscle's unique features include the ability to link up to 15 motors which can operate together in complex sequences without an additional controller. Cool Muscle is able to use a physical limit of travel as its reference position, using torque sensing to safely and accurately find the limits of travel without needing a position sensor (e.g. limit switch).

The high level of integration provided by Cool Muscle reduces cabling, keeps components to a minimum and speeds up system assembly.

Cool Muscle is ideal for laboratory and test equipment or for light industrial automation.

#### Software interface

For programming details for the C-Type Reliance Cool Muscle see Technical Information pages T2-3 to T2-5.

#### 'Y' cables

# **Reliance Cool Muscle Motor**

#### **Communication cards**

RS485, PROFIBUS and Ethernet cards are available as options for the Reliance Cool Muscle servo system. Our engineers provide technical support based on extensive experience integrating the Reliance Cool Muscle with third party controllers, HMIs and PLCs.

#### **Power supply**

Designed specifically for the Reliance Cool Muscle, this power supply is built to withstand the current draw spikes which the hard stops or starts often require. Specification of the power supply is 150 W/300 W, 6 A/10 A.

#### Cables

A standard motor cable (40 cm) and varistor are supplied with every motor. Longer motor cables are available as an option.

A Y-cable is required to connect the Reliance Cool Muscle to a USB or serial port,

#### see page 2-11

Multi-motor custom cables can be made to suit your application.

#### Control room

Control Room is a free application which provides basic tools for setting parameters and creating motion profiles. A user friendly interface makes it easy to work with the Reliance Cool Muscle

Control Room replaces the CoolWorks software.

CoolWorks continues to be supported by Reliance.

We provide a range of associated products which compliments the Reliance Cool Muscle and enhance its performance, including couplings, gearboxes and linear motion components.

#### Reli-a-Flex<sup>®</sup> flexible shaft couplings

The Reli-a-Flex<sup>®</sup> range of one piece slit couplings has been specially designed to provide accurate transfer of motion between two rotating shafts while at the same time catering for parallel and angular misalignment as well as protecting the bearing systems. See page 8-6 for more information on the Reli-a-Flex<sup>®</sup> range.

#### **Planetary gearboxes**

A range of high quality planetary gearboxes is available to suit your application needs. Combine a low backlash, zero maintenance and high durability gearhead with the Reliance Cool Muscle to maximise performance. Available in NEMA 17 and 23, ratios 3:1 to 512:1. See page 3-3 for more information.

#### Intelligent actuator systems

A range of intelligent actuators is available to support your precision motion control needs. These include rack actuators and positioning stages for use with the Reliance Cool Muscle. Please contact us or visit the website for more information; www.reliance.co.uk/shop See pages 2-14 to 2-23 for more information.

## Precise, efficient linear motion

This compact actuation system combines the Reliance Cool Muscle servo system with a rack and pinion drive to give precise linear motion for high speed applications.

Multiple configurations are available developing peak forces up to 150 N and rated speeds of 300 mm per second, with resolutions of better than 1 micron and standby power consumption of less than 1.7 watts. The assembly has a number of different mounting options for ease of mechanical installation.

The Racktuator<sup>™</sup> has built-in closed loop control with an integrated 32 bit CPU, magnetic encoder and PLC. This intelligent assembly can be programmed to decide for itself where it should be at any given time and to send out continuous motion data such as speed, position and torque. The unit is fully integrated, saving space and cost, and makes system integration faster and simpler with control at the point of use. The Racktuator<sup>™</sup> is fully programmable and can store onboard discrete

positions, speeds, accelerations, timers, torque limits and custom variables, all to be recalled by up to 15 separate motion control programs. It also has built-in maths and S curve functions for advanced motion control.

Multiple Racktuators<sup>™</sup> can work in sequence, either to produce circles, ellipses, or complex arc motions, or in a daisy chain network to automate pick-and-place machines. The Racktuator<sup>™</sup> can be operated independently or communicate with a PC host via RS232 or USB. It can also be fitted with a traditional stepper motor, being driven by step and direction signals or with CW/CCW pulses to bring the advantages of an AC servo system to any stepper motor application.

The Racktuator™ is available with both solid and tubular racks, suitable for a variety of applications from scientific research to food preparation and packaging.

## Motorised leadscrew-driven linear slide

The RCMS series of leadscrew stages combines the high speeds and programmability of Reliance Cool Muscle motors with the accuracy and reliability of a leadscrew-driven linear slide.

The RCMS is available with two different motor sizes and in a wide range of travel lengths and leadscrew and carriage configurations.

The precision slide's aluminium guide and carriage are driven by a rolled stainless steel leadscrew, available with metric and imperial leads. High performance polymers and TFE coating extend the life of the slide's moving parts.

The Reliance Cool Muscle motor, in NEMA sizes

17 and 23, integrates an efficient vector drive and H-infinity controller with a 50,000-count encoder to form a servo positioning system operating at speeds from 0 to 3,000 rpm with minimum power consumption. Cool Muscle's torque sensing and software travel limits give the option of eliminating home and limit switches from your system.

Typical applications for the RCMS include test instrumentation used in industrial automation and university laboratory research equipment used by the energy industry.

## Hybrid linear actuators

Reliance offers a range of low maintenance hybrid linear actuators for equipment designers who require high performance and exceptional endurance in a very small package. The actuators are engineered with custom thermoplastics in the rotor drive nut and a stainless steel leadscrew. This allows the linear

actuator to be quieter, more efficient and more durable than the standard acme thread and bronze nut configuration commonly used in other linear actuators.

The hybrid linear actuators are available in NEMA frame sizes 8 to 34, with up to 400 full steps per revolution and travel increments as small as 0.003 mm/step.

There are three configurations:

- · captive shaft
- non-captive linear
- external linear

Captive linear actuators offer a short stroke in a compact package where anti-rotation of the shaft is not possible by any other means. These units convert rotary to linear motion via an integrated leadscrew and nut. The integrated leadscrew is held captive within the motor housing, welded to a stainless steel spline arrangement. This provides anti-rotation of the leadscrew enabling precise linear movement.

The non-captive linear actuator leadscrew travels through the motor giving an extremely short footprint. As with the captive shaft actuator, conversion of rotary to linear motion takes place within the motor itself by means of the integrated leadscrew and nut, therefore eliminating the use of belts and pulleys, couplings and other mechanical transmission components.

Size 8

Size 11 and Size 14

Size 17 and Size 23

Size 34

External linear actuators combine conventional leadscrew and nut technology with stepper motor technology. The leadscrew forms part of the motor shaft negating the need for a shaft to shaft coupling, thus providing zero transmission error from motor to screw and shortening the overall linear footprint.

Contact us for details of products and specifications.

ntelligen

## **Can-Stack linear actuators**

For volume applications we also offer Can-Stack linear actuators, which are a threaded rotor in conjunction with a leadscrew shaft to provide rapid linear movement in two directions (inward and outward). They are available in captive shaft, non-captive linear or external linear variants.

Unique features give ruggedness and reliability that assure long life and consistent performance. Rare earth magnets are available for even higher thrust. The actuators are built with dual ball bearings for greater motion control, precise step accuracy and long life.

Applications for the Can-Stack linear actuators include medical instrumentation, machinery automation, robotics and other automated devices which require precise, remote controlled linear movement in a broad range of temperature environments, whilst the hybrid linear actuators are ideal for applications requiring precise positioning, rapid motion and long life, including XY tables, medical equipment and semi-conductor handling equipment.

Micro dispensing syringe drive

Pharmaceutical testing equipment

## **Customised configurations**

In addition to standard configurations the actuators can be modified to meet specific application requirements. Reliance's applications engineering experience, manufacturing and assembly capabilities enable us to provide modified products and bespoke assembly solutions, see page 2-18.

## Linear rail actuators

The linear rail actuator consists of a stationary base and load bearing carriage that travels along a rigid extruded aluminium rail, together with a single stack size 17 stepper motor.

The carriage design is unique; it controls slide bearing play with a self-adjusting linear bearing. Integrated along the entire length rail system are "T" slots allowing mounting of limit switches and sensors.

The leadscrew is made from 303 stainless steel with a Black Ice™ TFE coating for durable and permanent lubrication.

The features of the linear rail actuator include:

- "T" slots integrated into exterior rail bottom and sides that accommodate full length support and various mounting options
- · Loads easily attach to the compact, moving carriage with four or six M4 x 0.7 size screws
- Load bearing carriage moves efficiently and smoothly within the internal rail geometry of this specially designed aluminum extrusion
- Rail provides end-to-end axial stability and precise motion system accuracy
- · Automatic adjustments of slide bearing play with a patent pending "anti-backlash" linear bearing
- · Rated life equals that of the existing leadscrews of similar size
- · Leadscrew end configurations adapt to various rotary motion sources
- Black Ice<sup>™</sup> TFE coatings on a 303 stainless steel leadscrew

For optimum performance, the system can be fitted with the Size 17 Hybrid Linear Actuator, see page 2-24 available in a wide variety of resolutions - from 0.001524 mm/step to 0.048768 mm/step, delivering thrust of up to 222 N. For greater performance Size 17 Hybrid Double Stack Linear actuators provide 0.0158mm/step to 0.127 mm/step and deliver thrust of up to 337 N.

## Introducing the motorised leadscrew linear slide range

Reliance offers a range of motorised actuator systems including the motorised leadscrew linear slide. It offers exceptional linear speed, accurate positioning, and long life in a compact assembly. One of its many advantages is that the length and speed are not limited by critical screw speed, allowing high

RPM and linear speeds, even over long spans. Lengths up to 2.4 metres can readily be built, and longer lengths are possible on a special order basis.

The motorised leadscrew linear slide features wear-compensating, antibacklash carriages to ensure repeatable and accurate positioning. The preassembled unit combines a screw-driven linear actuator with an integrated stepper motor drive reducing part count and improving system integration.

It is available in standard and wide base options, each capable of supporting a range of load capacities. There are four variants of the standard base supporting 67 N, 156 N, 222 N and 445 N, and two of the wide base to support 156 N and 445 N. Both are available with a right or left hand thread; the nominal thread leads are shown in the table opposite. The stepper motor is available in three sizes - NEMA size 11, 17 and 23, alternatively the actuator can be supplied integrated with the Reliance Cool Muscle motor, see pages 2-19 to 2-23, or as a non-motorised leadscrew linear slide see page 7-38.

Typical considerations when selecting a linear actuator include:

- · How much force is required from the linear actuator?
- · What is the duty cycle of the linear move?
- · What is desired step increment from the linear actuator?
- · What is the step rate or speed of travel?
- Bipolar or unipolar coils in the stepper motor prime mover?
- · Stepper motor coil voltage?
- Must the lead screw hold position with power off or must it be "backdrivable" with power off?
- Are there size restrictions (max footprint of the linear actuator)?
- · What is the anticipated life requirement?
- Temperature of operating environment?

Please contact us to discuss your requirements.

## Introduction to the range

Our standard product range includes planetary, bevel and hypoid gearboxes, which provide housed, modular solutions, as well as an epicyclic gear module, which can be used in single or multiple stacks to build a customised gearbox. We also provide design, manufacturing, assembly and test services to create custom gearbox solutions, designed to specification.

## **Standard gearboxes**

Planetary gearboxes

Bevel gearboxes

Epicyclic modules

## Custom gearboxes

Custom-designed gearboxes

Concept development and prototype

Gearboxes for harsh environments

## **Planetary gearboxes**

Planetary gearboxes give the ability to increase the torque and lower the speed of an electric motor, such as a stepper motor, thereby transforming the power and improving control of an electro-mechanical system.

The Reliance planetary gearboxes offer low backlash, high torsional stiffness, and high levels of efficiency, suitable for industrial automation applications. They are ideally suited to working with the Reliance Cool Muscle intelligent servo system in high torque applications where positional feedback is important.

We offer 3 planetary gearboxes – the RGP40 and RGP60 provide a compact solution for integration with Reliance Cool Muscle, whilst the RGPN70 is for higher precision, higher stiffness, higher torque and lower backlash applications.

Reliance Cool Muscle servo system

## Economic, space saving solutions

The Reliance bevel and hypoid gearboxes provide an economic, space saving solution for right angle motion in a restricted space envelope. There are 3 types of gearbox available:

#### The BE series

The BE series is the most economical choice, offered with stainless steel bevel gears mounted in plain bearings, with either 1:1 or 2:1 ratios. It is a small, compact, anodised aluminium unit, with a removable, plastic, clip-on cover. The unit can be easily mounted into an assembly to provide a 90° drive where space prevents a direct layout.

#### The BS series

The BS series is a one-piece, slim-line aluminium housing with stainless steel bevel gears and shafting, offered in single or double output configurations with either 1:1 or 2:1 ratios. Using ISO 8 quality bevel gears, when assembled the backlash of the assembly is as low as <20 arcmins. It has a completely sealed casing providing a dust free and safe operation, with pre-tapped holes for alternative easy mounting. It is lubricated with high quality grease before sealing, providing lifetime lubrication and low maintenance.

#### The HY series

The BS and BE series bevel gearboxes are suited to lowload industrial applications. For higher ratio requirements, between 5:1 and 10:1, we offer the HY series hypoid gearbox, also with a fully sealed aluminium housing and carbon steel gears and shafting. The hypoid gear pass allows for a high torque transmission coupled with a high ratio all within a compact package. Mounted in ball bearings the unit is fully lubricated and sealed for life. The variation of mounting holes allows the gearbox to be mounted on any face for greater assembly flexibility.

#### The BE series

Pictured without its removable cover, the BE series gearbox shown with Reli-a-Flex<sup>™</sup> couplings, leadscrew and Reliance Cool Muscle motor in a typical right angled drive system.

# The BS series

A single input, dual output BS series shown with Reli-a-Flex<sup>™</sup> couplings, leadscrews and Reliance Cool Muscle motor.

# **Epicyclic Modules**

# **Epicyclic Modules**

Reliance offers a component gear set with a modular design approach for building a custom gearbox based on standard modules. It can be used as an individual stage, providing ratios of up to 5:1, or the modules can be stacked to create a higher ratio gearbox. It is ideal for heavier duty, or long-life, torque amplification, and speed reduction applications; the units have been used successfully in sealed sub-sea applications and in motorsports mechanisms.

The gear modules can also be supplied mounted in an aluminium housing complete with output shaft and support bearings, or as a housed unit completed with input and output shaft.

#### **Transmission efficiency**

98% per single unit, 95% in double units, the power source may be smaller than with many other reduction gears.

#### **Noise reduction**

Gear noise is reduced by a special construction of disk-sided planetary gears.

#### Load equalised structure

The inherent problem of loadsharing with planetary gear systems is solved by the load equalised construction.

#### High torque transmission

The epicyclic module is a compact unit with high torque transmission because it is designed to equalise the loads of each planetary gear.

#### Many reduction ratios

It is possible to obtain many reduction ratios by combining standard units (3:1, 4:1, 5:1).

#### ACCESSORIES

The initial module accepts a D-shaped motor shaft. Subsequent modules use the input shaft (external spline) to plug into the output (internal spline). Finally, output internal spline adaptors are available, see below, and spacer rings should be inserted between each module as required.

	Function	Part Number	Material	Weight g	Description
1.	Spacer ring	MEM75-903	POM	12	For spacing modules at the correct distance
2.	Ø12 O/P shaft	MEM75-907	SCM435	50	10 Nm torque rated
3.	Ø32 O/P shaft	MEM75-906	S45C	720	For customer to machine to requirements

# **Custom gearboxes**

As well as offering a range of standard gearboxes we also design and manufacture bespoke gearboxes. As with our bespoke gears (see page 4-4) these are typically used in the aerospace and defence markets, and other industries with performance-critical requirements.

With over 50 years' experience in gearbox design, manufacture, assembly and test Reliance's engineers have a wealth of knowledge to draw upon when designing a solution to a customer's specification. We have designed and built gearboxes for prime contractors and leading OEMs in the aerospace industry which are used in flight critical applications on global programmes such as Eurofighter Typhoon, Sea Harrier and Tornado.

We specialise in fine pitch gearing for long-life applications, short-life, high power applications and rotary to linear actuation drive mechanisms.

Our manufacturing capability extends to component cleaning and clean assembly, allowing us to address requirements for geared solutions for vacuum applications.

An extensive suite of test equipment enables thorough validation of the gearbox design and construction. This includes a Transmission Error Measurement System (TEMS) which enables investigation of the accuracy and backlash of the full geared system, environmental test equipment and accelerated life testing, all of which help ensure that the gearbox will perform within specification for the entire life of the product.

# A complete precision gear range

With over 50 years of experience in the design and manufacture of precision spur gears, Reliance has developed an extensive range to suit a wide variety of customer applications. Alongside precision cut gears we offer hardened and precision ground gears for applications requiring higher load capacity and a very competitive range of brass gears for applications where there is a need to balance accuracy and load capacity against cost. Typical diameters range from 5 mm to 100 mm.

# **Precision cut gears**

Our precision cut spur gear range offers anti-backlash, spur, hubless and hardened gears with many hundreds of thousands of combinations of bore size, face width, material, module and number of teeth. In line with our commitment to meeting customer requirements, any tooth number that can be configured for any given gear diameter can be supplied. This allows our customers ultimate flexibility when selecting their gear ratio and the ability to use the smallest or most practical centre distance.

Gears are available in standard modules from 0.2–1.5, bore sizes from 2–25 mm and to a minimum quality class of AQ10 (for definition of AQ10 see page T4-1). Manufactured from aerospace standard stainless steel and aluminium alloy Reliance standard precision gears can be specified for the most demanding applications. For customers that require higher transmission accuracy, to measure position more accurately or extend life in high speed applications, all Reliance's precision gears are available up to quality AQ14.

For applications that require more torque transmission, a standard range of 17-4 PH, hardened to condition H1025, is available. Further material choices are offered, commonly PEEK or acetal can be specified where low noise and/or insulating properties are required. For other application-specific requirements our engineers can help in the selection of exotic materials or add some customisation features to the component.

Reliance anti-backlash gears have been developed over a number of years and are manufactured with a two-piece construction. The fixed plate and hub are manufactured in one piece, which provides maximum integrity when attaching the gear to a shaft. This manufacturing method is far superior when compared to alternative anti-backlash designs which use a three-piece construction, with the hub and fixed plate joined together by a metal deformation technique such as swaging or riveting.

Plain precision gears

Anti-backlash gears

Hubless gears

Reliance has a dedicated manufacturing cell where modifications can be carried out quickly and economically to customer specification. Typically weight reduction features or alternative fixing methods are requested – please contact us to discuss your

For fast, efficient and accurate selection of our precision cut gears we provide a gear builder facility which is available to use on-line. The on-line selection process gives all the required technical and commercial information appropriate to the gear specification, part description and item number.

Modification service

requirement.

# Precision ground gears

Gear manufacture and test

The precision ground spur gear range, manufactured from chromium molybdenum steel hardened to 49-55 HRc, and with tooth profiles manufactured to ISO grade 5, is ideal for higher loaded, mechatronic applications. Available from stock or on short delivery the bore and the faces of the gears are purposely left soft to enable quick modification to suit alternative fixing or shaft diameter requirements.

# **Brass gears**

The brass spur gear range is also available from stock or on a short delivery and provides customers with an economical alternative for less demanding applications. Manufactured from high grade brass, ISO CuZn39Pb3, the standard range of spur gears also includes pinion shafts with tooth numbers as low as 10 and a small range of internal gears (see page 5-15).

On-line gear builder

# Design and manufacture of custom gears

Alongside our extensive range of standard catalogue gears Reliance also designs and manufactures bespoke gears to customers' requirements. Reliance has over 50 years of experience in gearing, ranging from high accuracy, long life applications such as radar and optical payload applications, to very short life highly loaded aerospace applications.

Gear specialists at Reliance are very happy to offer advice on the design strategy for custom gears and can help with datum positioning and dimensioning to achieve the best possible accuracy at the most economical cost. For example, simply utilising the mounting feature of the gear as the datum for the gear cutting operation avoids unnecessary tolerance build ups and interim manufacturing operations.

Reliance's engineers have a detailed knowledge of the principles of gear tooth generation and the resulting contact conditions. This enables them to work with engineers in other industries to offer advice on the modification of gear teeth to provide bespoke contact conditions that enhance the performance of the gear pair, or to achieve an imposed centre distance within the constraints of the design environment.

Typical market areas are aerospace, space, defence and down-hole instrumentation where performance-critical applications demand a deep understanding of gear geometry. Both external, internal and combination gears can be manufactured using high accuracy hobbing and shaping machines with a module range of between 0.2 to 1.5 module and a diameter range from 2 to 330 mm.

Custom gears can be manufactured from a range of materials such as, but not limited to, stainless steel, aluminium alloy, precipitation hardening steel, phosphor bronze, titanium and other speciality metals, as well as high performance polymers such as PEEK. Reliance also works very closely with accredited and formally approved surface coating and heat treatment specialists to provide most industry standard processes.

During manufacturing all gears are individually inspected for gear quality and size using a dual flank inspection process with maximum accuracies of 3 microns tooth-totooth and 5 microns total composite error. For demanding applications gears are inspected for lead, pitch and profile on our Klingelnberg P40 gear measuring machine.

Our expertise also extends to the associated structure in geared assemblies where we can provide design for manufacture advice or a full design from specification service. Typical projects can involve concept design, development testing, prototype manufacture, performance validation testing and production manufacture with final acceptance testing, see page 3-28.

## Ground spur gears

Ground spur gears are ideal for high speed mechatronic applications where higher loads and accurate motion are required.

- Modules 0.5 to 1.0 available.
- Manufactured from chromium molybdenum steel, hardened to 49-55HRc.
- · Standard gear quality: ISO 5
- Bore diameter, outside diameter and other surfaces are ground to provide location datums when additional machining is required. Additional machining of the bore is not recommended.
- Keyway features available see page 4-69

## Features

- Material: Chromium molybdenum steel (ISO 34CrMo4, 42CrMo4)
- · Gear tooth treatment: Induction hardened to 49-55 HRc
- · Gear quality: ISO 5
- Gear tooth surface finish <sup>16</sup>√
- Keyway features available see page 4-69

#### Part Technical Support

- For transmission capacity see page T4-17
- Part number structure see page 4-60
- · For modified or fully bespoke gears, please contact us

12	4 x 1.8	4	±0.015	1.8	-0

## 🚹 Features

- The keyways above are available as options, add -K to the end of the part number
- · Additional custom keyways are available, please contact us

## **Brass gears**

Brass gears are ideal for lightly loaded applications, an economic balance of accuracy and load capacity against cost.

- Modules 0.3 to 0.75 available
- Manufactured from brass (ISO CuZn38Pb2, CuZn39Pb3)
- Standard gear quality: ISO 9 10

## Part number structure

Additional brass gears are available in the precision gear range - see page 4-6

# **Brass Pinions**

All dimensions in mm Pressure angle 20°

Associated Products Set screws: page 13-1 Shafts: page 11-2 Bearings: page 12-1 Shaft Pinion - in part number denotes shaft pinion type Pinion

## Worms, bevels and internal gears

Reliance offers a range of worms and wheels, bevel and internal gears that are designed to complement our spur gear range by offering additional motion options. As with the spur gears these gears are offered as precision grade in stainless steel and brass as a more economical alternative for less demanding applications.

## Worms and wheels

Worm and wheel drives provide high ratio right angled motion in a small space. Both precision cut and precision cold rolled worms are available (refer to the features, options and technical information on the individual product pages). In general, for more accurate applications the precision cut worms will give the best results and for applications requiring a little more torque transmission precision rolled worms should be used.

Please note that this catalogue only shows a limited range of worms and wheels. Reliance has the ability to cut worms and wheels from 0.2 module up to 1 module; please contact us for requirements for special variants.

## **Bevel gears**

Bevel gears are more efficient than worms and wheels for right angle drives, but they are typically used for lower ratio applications; if high ratios are required a spur gear reduction stage can be incorporated. Typically shaft angles of 90 degrees are used but other angles are possible – please contact us to discuss your application.

As with the worms and wheels, bevel gears are available in stainless steel and brass; the stainless steel option being higher precision than the brass option. It is important to note that with the bevel gears, where two gears are shown on the page the part number refers to the gear pair. Where only one gear is shown on the page the part number applies to individual gears only – for a pair, two gears must be ordered.

#### Internal gears

A small range of brass internal gears is offered for use with the brass gear range.

## Accurate conversion from rotary to linear motion

A rack and pinion system gives the ability to transfer rotary to linear motion, with all the accuracy expected of a geared system.

The racks are manufactured from ground, hardened stainless steel or ground stainless steel and available with a choice of accuracies, pitches, and lengths, plus the facility to provide modifications such as flats, journals or custom ends. Hobbed stainless steel and brass racks are also available. The rack pinions are plain or anti-backlash, also with a choice of accuracies, pitches, bore sizes, alternative materials and coatings.

Ground racks can be used for both measurement and actuation. In general the smaller pitches (1 mm) suit measurement as the smaller pinion diameter gives higher linear resolutions. The larger pitches (2 mm and 2.5 mm) allow for a higher load capacity. For most

applications the rack can be used for both the feedback and the actuation; however in very precise applications it is best to us a non-drive section of the rack for feedback, alternatively a separate rack can be used. Hobbed racks are more suited to light actuation applications where cost is a key consideration.

We offer three types of rack – rectangular racks, solid round racks and tubular racks. Rectangular racks are used when the application requires the rack to be stationary and the rack pinion provides the element of motion. Our rectangular racks are used with a motor, slide and carriage for example in the printing industry for the actuation of paper cutting knives in a printing press. Round racks are a more flexible alternative, with regard to mounting, used for example in XY stages. The tubular racks allow for the passage of fluids, fibre-optics, gasses etc, making them ideal for medical and scientific applications, such as laboratory automation pick and place mechanisms.

For a fully integrated solution the Racktuator<sup>™</sup> (see page 2-14) is a combined rack and intelligent motor actuation system. Bringing together Reliance's racks and Cool Muscle servo system, the Racktuator<sup>™</sup> provides a very high level of control and accuracy in a compact, space saving package.

R9-25M-300	2.5		11.391	

#### Features and options

- Cumulative pitch error less than
   0.008 mm per 300 mm
- · Ground teeth, accuracy grade 4 as standard
- Alternative grades available see page T6-1
- Unlimited axis lengths possible by setting
- individual racks togetherShorter lengths available
- Alternative pitches, including module

#### Particul Support

- Installation information see page T6-4
- Technical information see pages T6-1 to T6-6
- PTFE based grease is recommended for lubrication
- For modified or fully bespoke racks, please contact us

# **Precision Ground Rack** Hardened Round

All dimensions in mm General tolerances ±0.13 mm Material: Linear bearing shaft stainless steel grade 440C or X90CrMoV18 Treatment: Case hardened to 55 HRc min Pressure angle 20°

Associated Products Rack pinions: page 6-10

## Part number selection table

Part Number	Circular Pitch (mm)	Outer Dia ØD	Pitch Height P	Rack Thrust (N)
RR12-1M-500	1	12	11.841	30*
RR12-2M-500	2	12	11.682	60*

\* Rack thrust based on meshing with a 60 tooth hardened rack pinion, theoretically calculated.

#### Features and options

- Cumulative pitch error less than 0.025 mm
- · Ground teeth, accuracy grade 3 as standard
- Higher accuracy grades available
- Bearing surface and drive in one component
- · Shorter lengths available
- · Alternative pitches available
- Flats, journals and end modifications

## Technical support

- Installation information see page T6-4
- Technical information see pages T6-1 to T6-6
- PTFE based grease is recommended for lubrication
- · Can be used with both open and closed linear bearings with either 4, 5 or 6 ball tracks (the bearing must be positioned so the balls do not run on the edges of the teeth - see page T6-3).
- · For modified or fully bespoke racks, please contact us

## Precise, efficient linear motion

Reliance's leadscrew and nut assemblies provide a flexible, integrated solution for linear motion. Available in a wide choice of leadscrew sizes and nut styles, with options for custom designed nuts and

leadscrew end modifications, the range offers the flexibility to address a wide variety of requirements.

Leadscrews are provided with leads from 0.3 mm to 92 mm, screw diameters from 3 mm to 19 mm and thread lengths of up to 4 metres, making them an effective solution, even for high linear speed applications. They are available in a range of materials and coatings, with a choice of cut or standard interfacing ends, or with the option of custom machined ends. The screw thread form has been specifically designed for long life and quiet operation. It is manufactured using a rolled process, a highly consistent method of production resulting in a cost-effective, quality product.

The leadscrew and nut assemblies have been designed specifically for motion control applications, rather than using adaptations of general purpose screws and nuts. There are 11 different leadscrew nut styles, with a choice of mounts and also options for custom-designed nuts. The leadscrew nuts are made from moulded plastic, which enables custom nuts to be produced with features of the drive system, such as bushings, carriages, pulleys and gears, integrated within the nut. This type of custom, multi-functional nut can offer a significant reduction in part count, reducing cost and assembly time in the overall mechanism.

The polyacetal nuts have a lubricating additive to provide longer life which, when combined with low friction leadscrew coatings, can extend the life of a standard leadscrew assembly by up to 300%. The assemblies are self-lubricating, making them ideally suited to medical and laboratory applications.

With lead accuracies up to 0.0001 mm/mm and positional bi-directional repeatability within 1.5 micron (0.0015 mm) on anti-backlash designs, the leadscrew and nut assemblies are ideal for applications requiring precise, efficient linear motion.

Part number structure

#### Leadscrew materials

Leadscrews are rolled from a premium grade, corrosion resistant and non-magnetic 303 stainless steel. Other materials are available including 316 and 400 series stainless steel, precipitation hardened steels, aluminium and titanium. These materials are ideally suited for industries such as medical, vacuum, cleanroom, food and human contact, salt spray and cryogenics.

#### Leadscrew coatings

Standard leadscrew nuts are manufactured from self-lubricating plastics. We also offer soft TFE and hard BFE low friction coatings for the leadscrew; lubrication to the screw/nut interface occurs by the nut picking up TFE particles from the coating as well as from migration of the internal lubricant from within the plastic nut.

We also supply leadscrews with specialist nickel/TFE coatings and offer a choice of coatings used in medium vacuum applications (up to 10<sup>-5</sup>). Alternatively a BFE coating can be provided. This is a special proprietary hard coating which shares many of the benefits of TFE coating but offers exceptional durability in more aggressive environments and where reduced friction and a permanent coating is desired.

Although care should be taken to ensure that chips and voids do not occur in the coating, small voids have been shown to have little effect on the system performance. The lubricant, although solid, has some of the "spreading" ability of fluid lubricants. When machining bearing ends, soft fixtures are recommended to protect the coating.

TFE coated screws provide the maximum level of self-lubrication and should not be additionally lubricated or used in environments where oils or other lubricant contamination is possible.

Coatings, available for only a small additional cost, give the best results on wear life, coefficient of friction and torque to drive the leadscrew assembly. To select a coating add -TFE or -BFE to the part number shown above.

#### Leadscrew ends

Leadscrews are provided with the options of cut ends or a range of standard end modifications suitable for interfacing with ball bearings, circlips, couplings, pulleys and gears. Alternatively custom end modifications can be supported. See pages 7-27 to 7-35.

# **Leadscrew Nuts**

Leadscrew & Nut Assemblies

**LBF MINI series** - Miniature nut for applications that do not require anti-backlash or wear compensation.

**LPX series** - Long life for applications that do not require anti-backlash or wear compensation.

LNTG series - Adjustable drag, compact design, anti-backlash nut assembly allows drag torque to be pre-set according to system requirements.

LAB series - Incorporates a lockable, adjustable sleeve to set the drag torque of the nut and to provide manual backlash control.

**LAF series** - Light loads. Precise position accuracy and repeatability. Anti-backlash.

**LCM series** - Light loads, compact design. Anti-backlash.

LNTB MINI series - Miniature anti-backlash nut for applications requiring axial stiffness through life with minimal drag torque.

LAK series - Moderate loads. Delivers increased load capacity and greater axial stiffness with low drag torque. Anti-backlash.

LAX series - Heavy loads. Delivers maximum load carrying capacity with highest axial and radial stiffness. Antibacklash.

LNTB series - Flexible design, self-compensating anti-backlash nut assembly maintains axial stiffness throughout its life with minimum system drag torque.

**LWD series** - Moderate loads. An anti-backlash, self-lubricating acetal nut. Compact design provides stiffness and accuracy for precise positioning.

**Custom Design** - Specials to suit your application.

# Leadscrew Nuts

## Alternative nut styles

Reliance offers a wide variety of standard nut designs and the matrix below is intended as a general guide to help select the most appropriate nut for the application. More detailed technical data is provided on pages 7-12 to 7-25.

#### Nut mounting options

The nuts are available in several different designs including anti-backlash, adjustable anti-backlash, general purpose and miniature. Most nuts are available with a triangular, round or threaded mount. Custom requirements can be supported using specialist mould designs, see page 7-26

#### Modified and custom nuts

All of the nuts can be modified to some degree to help tailor them to specific requirements, alternatively fully customised nuts can be supplied, see page 7-26.

#### Nut materials

Due to the controlled manufacturing processes, we can offer nuts in different types of plastics that can be moulded, e.g. PEEK, special carbon or other fibre filled plastics. Even though the standard design and materials developed for the leadscrew nut assemblies are commonly plastics, metal nuts made from bronze, brass or aluminium alloy can also be supplied. For the optimum technical and cost effective solution, we are able to supply special moulded nuts impregnated with carbon fibre for strength, or nuts over-moulded on metal to help minimise the number of components in the assembly.

#### Modified, custom and multi-functional nuts

In addition to the standard nut types, custom configurations are available as well as simple modifications such as different mounting hole patterns or mounting threads, small dimensional changes or special materials.

Custom nut designs can offer multi-functionality, eliminating additional components, simplifying product manufacture, saving space and reducing cost. Multi-functional nuts can be produced using custom moulds and special machining to integrate components into the nut, such as guide bushings, carriages, timing pulleys, gears, syringe components, sensor mounts and flags, encoder features, clamps and many other complementary elements. In addition, custom designed nuts can offer quick release mounts, partial thread engagement, half nut construction or alternative shapes and geometries.

Special materials are available to extend the performance of the assemblies. We offer a range of Kerkite® composite polymers. Each member of the Kerkite® family is compounded lubricants. reinforcements with and thermoplastic polymers formulated to provide optimum performance in its target conditions and applications. In addition to the Kerkite® composite polymers, materials such as PEEK. polyester, Torlon, Vespel, PVDF, UHMW, Ertalyte® are available. Materials can be chosen for extreme temperature, chemical compatibility, autoclaving, agency approvals, special loadings and many other specific requirements.

Custom geometries and materials can be combined for a wide variety of product application requirements. Small quantities of custom nuts can be machined individually to suit specific requirements, alternatively large quantities can be moulded for reduced costs.

To achieve the most effective nut design we consider a combination of tolerancing and geometric shape of the nut. Tighter tolerances can be achieved by designing in geometric features to control important diameters, for example use of a ribbed feature on a bearing location diameter will reduce the need for tighter manufacturing tolerances.

#### End modifications

Leadscrews are supplied with cut ends as standard. Alternatively we supply a selection of standard machined ends suitable for interfacing with a range of associated products including; bearings, circlips, coupings, pulleys and gears.

End D - Twin bearings & coupling : page 7-31

End E - Ball bearing & pulley : page 7-32

End F - Ball bearing & gear : page 7-33

End A - Ball bearing : page 7-28 End **B** - Ball bearing & circlip : page 7-29 End C - Ball bearing & coupling : page 7-30

Ordering your modified end detail

#### To order a leadscrew with machined ends, use the ordering example below. If only one end is to be machined leave the 2nd end machining suffix blank.

#### Custom machined leadscrew ends

We are also able to supply custom machined ends to drawing; the drawing and specification details required and tolerances available are provided on page 7-34 and 7-35. Please contact us to discuss your requirements.

All dimensions in mm

#### **Required drawing details**

To order a leadscrew with custom machined ends please provide the following drawing infomation:

#### **Drawing tolerances**

General manufacturing tolerance ISO2768-mK. If a shoulder is required for bearing location at the extremities of the leadscrew thread then a bearing journal diameter of less than the leadscrew thread root should be selected.

All journals that are larger than the thread root of the leadscrew will have the scroll of the leadscrew thread root evident.

#### **Further machined features**

Cross holes: Symmetry 0.25mm Hole position 0.1mm Hole diameter 0.025mm Bored end holes: drilled depth 0.5mm

Bored hole depth 0.25mm

For bored holes up to a length of 4 x the diameter a tolerance of 0.013mm can be achieved. For bored holes over a length of 4 x the diameter a tolerance of 0.025mm can be achieved. Width of keyways 0.025mm.

#### Machined journal recommended tolerances (1) For journals over Ø3.2 mm and under 19 mm long and for use with Reliance bearings and gears for the optimum assembly and function we recommend a tolerance of or greater than: -0.005-0.017For journals under Ø3.2 mm and over 19mm long and for use with Reliance couplings, pulleys etc. we recommend a diameter tolerance of or greater than: -0.005 -0.027 For an additional charge Reliance can provide a minimum journal tolerance of 0.008 mm. This is dependant upon the journal length, geometry, diameter and material. Runout 2) To geometrically control journals and end machined features, Reliance measure runout as opposed to concentricity. The standard runout tolerance is 0.05 mm referenced to the datum A zones. 0.035 mm is available for precision journals of lengths less than 25 mm. 0.025 mm is achievable for journals less than 13 mm. Datum 3) The leadscrews are manufactured using a cold rolling process therefore a datum is located on the outside diameter of the leadscrew thread. The datum is specified at the marked datum 1 zones which are as standard 25 mm from each end of the leadscrew thread. **Overall length and leadscrew thread length** 4) Tolerancing for lengths: From 25.4 mm to 228 mm tolerance ±0.25 Over 228 mm to 812 mm tolerance ±0.5 Over 812 mm tolerance ±1.0 (5) Straightness 0.025 mm per 100mm of length. For screws less than 300 mm long the default value is 0.075 mm. (6) Journal length The tolerance of ±0.1 or greater should be used in general. For shorter journals of less than 25 mm ±0.06 can be achieved. (7) Secondary threads Include the size and pitch of the required thread e.g. M6x1, and include the thread fit tolerance i.e. 6q. A standard thread undercut may be used at the discretion of Reliance, the undercut will be 1-3 x thread pitches wide and to the thread root diameter. (8) Corner radius A small manufacturing undercut may be required to achieve the required corner radius, dependent upon the manufacturing method used. In general this will be for a corner radius of 0.25 mm or smaller. 9 Leadscrew nut Reliance strongly recommends that wherever possible the leadscrew nut is included on the leadscrew drawing and they are supplied as an assembly. This ensures the fit between leadscrew nut and leadscrew is completely controlled. The orientation of the nut should be defined. (10) Circlip grooves Circlip grooves can be achieved when manufactured in line with the tolerances shown above. Flats (11)

If the flat is for location purposes then we recommend specification of a flatness of 0.03 mm across the face.

## **Leadscrew Assemblies**

## Introduction

Reliance's range of Leadscrew Linear Slides and ScrewRail<sup>™</sup> assemblies provide a further level of component integration as opposed to a standalone leadscrew and nut assembly. These higher level assemblies combine leadscrew and nut assemblies with additional system elements such as bearings, carriages and housings, helping to simplify the design and manufacture of motion systems.

Leadscrew linear slide

ScrewRail<sup>™</sup> assembly

#### Leadscrew linear slide

The leadscrew driven slide offers reliable, continuous linear speed whilst maintaining accurate positioning. It is not limited by critical screw speed, allowing high rpm and linear speeds. It has a unique, compact profile that provides exceptional torsional stiffness and stability for its size and weight.

The unit is a single piece aluminium extrusion which houses a stainless steel leadscrew together with an integrated pre-loaded nut and carriage. It is designed for connection to a motor drive mechanism and is provided with appropriate leadscrew machined end(s) and bearing(s) for connection via a coupling, a series of pulleys or a geared system.

It is a fully supported leadscrew actuator, which enables longer travel, higher speeds and higher loads, compared to a standard leadscrew and nut assembly arrangement, without the need for additional support elements. The integral mounting base provides support over the entire length.

The Leadscrew Linear Slide provides linear actuation with 0.0006 mm/mm lead accuracy. It is offered in an extensive range of travel lengths, from 11 mm up to 1000 mm, range of diameters to support loads up to 46 kg and range of leads to provide different linear speeds. It has a double bearing design and is Teflon coated across all surfaces, giving smooth, accurate movement.

This robust, integrated unit is suitable for a variety of applications including laboratory automation equipment and industrial automation.

### ScrewRail<sup>™</sup> assembly

Where linear motion has traditionally required separate components to handle both the drive and support/guidance the compact ScrewRail™ combines both functions in a single, coaxial component. By eliminating the need for external rail-to-screw alignment the ScrewRail™ simplifies the design, manufacture and assembly of the motion system, saving as much as 80% of the space used by a two-rail system and helping reduce component and assembly costs.

The ScrewRail<sup>™</sup> consists of a precision rolled leadscrew, supported by sealed bearings, contained within a concentric steel guide rail, driving an integrated nut/bushing. Because all the alignment requirements are achieved within the ScrewRail<sup>™</sup>, support and positioning of the ScrewRail<sup>™</sup> is much less critical than with traditional slide assemblies. TFE coating and self-lubricating nut/bushing materials ensure long life, without maintenance. Standard end supports are available to mount the ScrewRails<sup>™</sup>.

With lengths of up to 1200 mm and with four diameter options, the ScrewRail<sup>™</sup> is capable of moving loads from 5 kg up to 45 kg. Two versions are available, with either plain or anti-backlash nuts.

The ScrewRail<sup>™</sup> gives three-dimensional motion from a single unit. When mounted vertically it can be used to simultaneously lift and rotate (Z-theta motion). With one motor driving the screw and a second rotating the rail, a compact pick and place mechanism can be created.

#### Introduction to the range

In many cases machine designers give limited thought to the shaft coupling. They devote their time to the more expensive components, overlooking the fact that the performance of a machine is only as good as the connections of its shafts. Reliance is fully aware of the importance of the shaft coupling and that they are often a critical part of the drive system. The Reliance range of shaft couplings has been carefully designed and tested to provide trouble free operation over many millions of cycles.

Perfect alignment is not practical in applications where two shafts need to be joined and therefore some level of misalignment will always occur. This misalignment is usually the result of the support block manufacturing tolerances and structural alignment. Unless these tolerances are very precise use of a solid coupling will result in high shaft loading and significant bearing loads. In certain cases this misalignment is limited to angular or radial misalignments, but is more often a combination of the two. Therefore, careful shaft coupling selection is important as differing configurations of coupling are designed to perform very differently dependent upon the application, and, as a consequence, have very different benefits and drawbacks.

Reliance engineers have many years of experience working with and specifying shaft couplings and are very happy to offer applications advice on coupling selection.

#### **Reli-a-Flex**®

The Reli-a-Flex<sup>®</sup> range of couplings is an aluminium alloy, one piece configuration, which has been designed in-house at Reliance to provide very smooth transmission of motion, high torsional stiffness, low bearing loads, and long life. The patented slot pattern was developed after many months of analysis and test to provide the best balance between zero backlash, torsional stiffness and low bearing load, whilst attaining an operational life in excess of 50,000,000 cycles at rated load and 80% offset. With two sets of identical slots, the Reli-a-Flex<sup>®</sup> coupling is constant velocity by design and handles angular, parallel and axial offset. Available in sizes from 6 to 40 mm outside diameter and allowable speeds up to 70,000 rpm, the Reli-a-Flex<sup>®</sup> coupling provides a very reliable one piece coupling design that approaches the performance of a bellows coupling.

Also for customers that require a modified or completely bespoke Reli-a-Flex<sup>®</sup> coupling, Reliance has developed a unique computer-based design and performance prediction tool. This tool allows our engineers to experiment quickly with different coupling configurations and to design a coupling to meet either space envelope restrictions or performance requirements.

#### Oldham

Oldham couplings are ideal where high degrees of parallel misalignment are present, assembly access is restricted and electrical insulation is required. Their construction of aluminium alloy hubs and nylon or acetal centre blocks allows separate assembly of hubs onto shafts and then simple engagement with the centre block on assembly where shaft movement is restricted. In addition, the construction of the centre block allows it to act as a torque limiter or overload device.

#### **Bellows**

Maintenance free zero-backlash bellows couplings are available with three construction options: for highest accuracy, nickel bellows; for torque transmission, stainless steel bellows; and where space is restricted, bronze bellows are available down to 12 mm outer diameter. Shaft fixing options are both set screw and clamp for the stainless steel and nickel bellows options, with the brass bellows option available in clamp type only.

#### Flexible disc

A number of different options of flexible disc couplings are available, based on both single and double disc spring construction. Please note that single disc spring couplings should only be used where the misalignment between the shafts is restricted to angular and axial. Single disc spring couplings cannot be used where radial misalignments are present. The RFSXK-2213 and 3019 type uses a novel design which places the clamps inboard of the disc springs to give the shortest possible overall length. The RFSXK-3850 type has an extended centre piece which allows high radial misalignment capability whilst maintaining good accuracy of transmission.

#### Curved jaw

Curved jaw couplings are available with both set screw and clamp hub type fixing methods. They are an ideal solution for reducing system torque ripple with a choice of three damping elements for high, medium and low torques.

#### Spiral beam

Available in stainless steel or aluminium and with a clamp or set screw style fixing, spiral beam couplings are suitable for general applications. Manufactured in one piece, spiral beam couplings are also maintenance-free.

#### **Friction clutches**

Friction clutches are available with two spring types. For lower torques up to 30 Ncm, the wire compression spring type should be used. For higher torques up to 120 Ncm, the disc spring version is the ideal choice.

#### **Radial tooth**

Radial tooth couplings are self centering on assembly and can be used to transmit high torques. These couplings must not be used where radial and axial misalignments are present and may require light lubrication depending on the application conditions.

#### Solid

Stainless steel or aluminium solid couplings, in one or two piece construction, can be used for connecting two accurately aligned shafts. Screws are prevented from loosening during operation by precision honed bores and Nypatch anti-vibration hardware, providing superior holding strength.

Bespoke coupling designed for a medical dosing machine

Product

Overview

**Reli-a-Flex**<sup>®</sup> - Unique design, maximises torsional stiffness without introducing high bearing loads.

**Bellows** - High accuracy, light duty. Maintenance free.

Flexible disc spring - Ideal for low torque applications requiring accuracy. Both external and internal hubs available.

**Curved jaw** - Shock absorbing, low cost general purpose coupling, ideal for reducing torque ripple.

Friction clutches - Variable torque settings. Gear manufactured to requirement.

**Radial tooth** - Positive connection, minimal axial misalignment.

**Solid** - One and two piece options. Excellent for accurately aligned shafts with high torque loads.

**Clamp collars** - No shaft marking, integral location face. One or two piece construction.

**Custom Design -** Designed and manufactured to suit your application, please contact us.

**Oldham** - Large offset, designed to separate for assembly. Electrically insulating disc.

**Spiral beam** - Universal one piece coupling. Aluminium and stainless steel versions available.

The couplings featured in this catalogue have been carefully selected to accommodate varying degrees of shaft misalignment whilst offering minimum distortion of rotation.

No one coupling provides a universal solution but the selection table below summarises the salient performance features for ease of comparison.

Full details for each coupling can be found on the product pages, with further technical information on pages T8-1 to T8-4. If you require technical support please contact us to dicuss your application and we will be happy to help you select an appropriate coupling.

#### Reli-a-Flex®, specifically designed and manufactured by Reliance to:

#### Improve system accuracy

The Reli-a-Flex<sup>®</sup> coupling provides excellent kinematic transfer of motion with high torsional stiffness, zero backlash and constant velocity.

• Extend system life

Product

Overview

The Reli-a-Flex<sup>®</sup> coupling introduces negligible radial and axial bearing loads, extending system life.

	Short or Long	<ul> <li>RCS type (short) where space is limited</li> <li>RCL type (long) where greater parallel offset and greater accuracy are required</li> </ul>
	Reli-a- Grip™	<ul> <li>The Reli-a-Grip<sup>™</sup> clamp enables Reli-a-Flex<sup>®</sup> coupling to be used to its full potential. Greater torques can be transmitted without the need to use set screws, which can potentially damage the shaft</li> </ul>

#### Picture perfect scanning with Reli-a-Flex<sup>®</sup> coupling

With the latest advances in digital optical scanning speed, professional flatbed scanner manufacturers are demanding more accuracy from their drive systems. A European company with leading edge technology in drum and flatbed scanners, image setting and integrated media processor products uses Reli-a-Flex<sup>®</sup> couplings in all their flatbed products. With XY technology, speeds of up to 50 scans per hour and resolutions of up to 5400 dpi, the accuracy and reliability of the Reli-a-Flex<sup>®</sup> coupling makes it the ideal choice.

Prior to the introduction of the Reli-a-Flex<sup>®</sup> coupling slight variations in the speed of the CCD element caused errors when trying to capture high resolution images. These errors manifest themselves as a colour registration defect, which resulted in an unacceptable banding effect across the image. Although these errors were small (typically 3.0 microns) they could easily be detected by the naked eye.

The cause of these errors was identified as the flatbed drive system. Introduction of a Reli-a-Flex<sup>®</sup> coupling manufactured from low inertia Grade 7075-T6 Aluminium was instrumental in bringing these registration defects under control. The unique slit pattern with radial rather than spiral slits gives the Reli-a-Flex<sup>®</sup> coupling high torsional stiffness and unsurpassed accuracy. However, with Reli-a-Flex<sup>®</sup> couplings high torsional stiffness does not mean high bearing loads, the Reli-a-Flex<sup>®</sup> coupling slit pattern has been carefully designed to give low bearing loads in conjunction with its high torsional stiffness.

Having been tested to 50 million cycles at rated torque, the Reli-a-Flex<sup>®</sup> coupling is also ideal for high duty cycle applications such as busy printing and typesetting applications. All in all the Reli-a-Flex<sup>®</sup> coupling has proved itself to be ideal for accurate positioning and responsive servo systems.

Specifications vary according to bore size. For exact figures, please enquire.

- Zero backlash, reliable one-piece construction
- Unique design maximises torsional stiffness without inducing high bearing loads
- · Minimal velocity and positional fluctuations
- Over 50,000,000 test cycles at rated load and 80% offset without failure
- · Maintenance free
- Recommended temperature range -80°C to +80°C
- Technical information see page T8-1
- Installation information see page T8-3

#### 3 - 20 mm Bore

### Reli-a-Flex<sup>®</sup> Precision Couplings Set Screw Type

All dimensions in mm General tolerances ±0.13 mm Material: Aluminium alloy grade 7075-T6 Finish: Surtec 650 Associated Products Shafts: page 11-2 Bearings: page 12-1 Leadscrews: page 7-1 Intelligent motors: page 2-2

RCL (long type) RCS (short type)

Couplings and Collars

Couplings are chambered for ease of assembly and fitted with stainless steel screws.

#### Part number selection table

#### **Bespoke designs**

The Reli-a-Flex<sup> $\otimes$ </sup> coupling can be customised to suit individual applications. For example, special interfaces can be incorporated into the design to allow easier interaction between the coupling and other components within the assembly. Alternative materials such as PEEK polymer and other plastics are available.

Reliance's design engineers can predict the achievable performance of Reli-a-Flex<sup>®</sup> confidently when provided with details of the allowable space envelope.

Please contact us to discuss your requirements.

#### Stocked range of Reli-a-Flex<sup>®</sup> couplings

The range of couplings below is held in stock and available on short delivery at reduced prices. It is subject to change from time to time, please visit our website at **www.reliance.co.uk/shop** for the latest details.

#### Particul Support

- Zero backlash
- · High torsional stiffness and low bearing loads
- Complete absorption of eccentricity, angularity and end play by spring action of the bellows
- Maintenance free
- Recommended temperature range -30°C to +120°C
- Product overview see pages 8-2 to 8-7
- Technical information see page T8-1

#### Particul Support

- · Zero backlash with acetal disc
- · High parallel misalignment capability
- Electrically insulated discs act as a mechanical fuse preventing damage to other components
- Temperature range:-

Acetal disc: -23°C to +65°C. Nylon disc: -23°C to +54°C.

- Max speed: 4,500 rpm
- · Acetal discs provide high torsional stiffness
- · Nylon discs provide vibration and shock absorption
- Technical information see page T8-1
- Installation information see page T8-3

## Low friction linear motion

The Reliance range of precision slides and guides provides a variety of linear actuation solutions for loads up 12,580 N and with lengths in excess of 1 metre. The range includes miniature linear guides, stroke slides, roller slides, rack driven ball slides and linear rails, together with spline shafts which provide both linear and rotary motion.

### Miniature linear guides

The linear guides consist of a stainless steel rail with a unique recirculating ball design in the carriage, which delivers smooth motion, low noise and high accuracy. The guides provide high levels of stiffness to enable the carriage to operate at higher speeds and with a 45° contact angle and a gothic profile design incorporated into the carriage, resulting in an equal load capacity in all directions, they provide high load and moment capacity. With their built-in lubrication reservoirs they provide an effective, low maintenance solution, further enhanced by specially designed seals to prevent dust and foreign objects from entering the system.

Linear guides are available with 3 mm to 15 mm wide rails and lengths up to 870 mm, offered in standard sizes or custom lengths, with carriages available in a variety of widths and lengths. Options are available for both lubrication and seals, with different mounting options accommodated via tapped or counter-bored mounting holes, and options for accuracies and pre-loading of the bearings where additional stiffness and precision are required.

Reliance's cut-to-length capability means that customers can order small quantities and samples for product trials or prototyping on a reduced lead-time.

### Miniature stroke slides

The miniature stroke slide offers a compact alternative to the linear guides for applications where a short stroke length is required, making it an ideal choice for a smaller space envelope. They are available in 7 mm to 12 mm wide rails and up to 100 mm length rails, providing up to 94 mm travel length. The stroke slides possess many of the same characteristics as the linear guides however there is no ball recirculation, rather the balls roll on rails resulting in smooth motion, low friction and high accuracy without vibration.

The linear guides and stroke slides are ideal for use in a linear actuation system, used in conjunction with the Cool Muscle intelligent motor and leadscrews or rack and pinions, to provide stable, accurate load movement.

### Ball and crossed roller

Ball and crossed roller slides provide very low friction linear motion in a compact package, with a high load carrying capacity, long life and high accuracy. They are similar to the miniature stroke slides, but available with rails from 4 mm to 38.1 mm widths and up to 381 mm lengths. The ball slides are also

available in a rack driven configuration suitable for controlled motion with a rack and pinion drive system. Rack driven ball slides are ideal for measuring position, driving a mechanism, or both, and can be used at very high speeds and loads.

### Linear rails

Linear rails offer a low cost option for systems where light loads are used. The linear rails exhibit a minimal frictional drag and long wear characteristics. They consist of a stainless steel shaft and composite polymer bushing, available with shaft diameters from approximately 6 mm to 19 mm and lengths up to 3,600 mm.

### Spline shafts

Spline shafts are suited to light to moderate load applications, where low cost, low friction and long life are the primary design considerations. They provide anti-rotation for one axis motion or a drive mechanism for two axes of motion. The assembly consists of a stainless steel spline shaft treated with low friction TFE coating together with a free-running or anti-backlash composite polymer bushing. Shafts are available in diameters from 3.18 mm to 19.05 mm, with lengths up to 3,600 mm. Bushings are supplied with an integral brass collar to facilitate various mounting configurations without nut distortion. Spline shafts are offered with a wide range of options including alternative materials, end modifications, multiple bushings and bushing modifications. An anti-backlash assembly is available for applications requiring minimum torsional play.

Note: Code size 19 is only available in material 14L14 carbon steel.

\* Only on thread mounting spline shafts.

\*\* 3.18 mm shaft diameter only available in SRSSBP and SRSSBY styles.

Note: Due to the process of manufacture, a small number of localised hollows and hard spots may be created. This will not affect the overall function or performance.

## Product options

- Lengths up to 3,600 mm available
- · Larger number of bushings
- Bush modifications
- · End modifications
- · Available in aluminium, please contact us

#### Material:

Spline shaft - Stainless steel, TFE coated Bushing - Graphite filled PTFE thermoplastic with brass collar

- Standard shaft straightness is 0.076 mm per 305 mm
- Typical radial clearance between shaft and bushing for free running assembly is 0.05 to 0.076 mm. Anti-backlash assemblies provide additional system stiffness
- · Designed for light load applications
- Maximum twist 3º/305 mm
- Torsional clearance 3° bushing to shaft
- Product overview see pages 9-2 to 9-3

## **Linear Rails**

All dimensions in mm General tolerances ±0.13 mm Material: Rail - Stainless steel Bushing - Composite polymer Associated Products Leadscrews: page 7-1 Hardware: page 13-1

The linear rail system has been designed for light load applications where low cost, minimum frictional drag and long wear life are primary design considerations - Product overview - see pages 9-2 to 9-3

			19	18.826	31.75	51.72	18.860	41.15	28.60	1.47	11.4

\*\* Including TFE coating.

- The assembly consists of a centreless ground and burnished stainless steel shaft mated with a composite polymer bushing
- The material combinations have been selected so that the thermal fluctuations have minimal effect on system performance
- Standard shaft straightness is 0.05 mm per 300 mm
- Standard typical radial clearance between shaft and bearings on TFE coated assemblies is 0.025 mm
- · Bushings are manufactured with standard retaining ring grooves

### Reinforced design for high speed running

During operation, the steel balls generate an impact force on the end caps when direction of motion changes. The RMR miniature design includes an embedded plastic inverse hook that tightly secures the carriage components and absorbs these impact forces. The high speed running capability of our linear guides has increased in line with the demands of rapid motion automation.

### Unique ball re-circulation design

The stainless steel ball re-circulation channels are sealed by plastic end caps, resulting in low noise during operation. The design of the lubricant store, which is embedded within the re-circulation channel, reduces the frequency of lubrication.

#### Bottom seal

The bottom seal, available on sizes 9, 12 and 15, prevents foreign objects entering the carriage assembly. The life of the carriage and rail is increased while running smoothness is uncompromised.

#### Stainless steel reinforcement plates

The plastic end caps are entirely encased by two stainless steel reinforced plates secured in place with stainless steel screws. The increased stiffness allows the carriage to operate at higher speeds.

#### Lubrication reservoir design

Lubrication is injected via holes located at both ends of the carriage and carried efficiently to the raceways by means of the re-circulating balls, thus increasing the maintenance intervals.

#### High load and moment capacity

The miniature linear guide series incorporates a gothic profile design with a 45° contact angle, providing equal load capacity in all directions. Large steel balls have been designed into limited space to provide enhanced load bearing and torsional resistance.

#### Dust proof design

Specially designed end seals prevent dust and foreign objects entering the system, increasing the product life. These seals are low friction and do not effect the smooth running of the linear guide.

- High load and high moment capacity
- High running accuracy and smoothness
- · Easy mounting
- Operating temperature of up to 150°C as standard. Higher temperatures of up to 300°C available. Note that the higher temperature options will have a lower load capacity
- Life rating calculations see page T9-2
- Lubrication details see page T9-2
- Product overview see pages 9-2 to 9-3

### **ReLIANCe CooL MuSCLe FeATuReS**

The Reliance Cool Muscle (RCM) is packed with features that help you reduce the size and cost of your machine while reducing development time.

#### Simple and Compact

An intelligent driver with a 32 bit CPU based motion controller, driver amplifier, magnetic encoder and power management are all built on to the motor.

### FuLL CLoSed LooP SySTeM

RCM is a fully closed loop system. With a high resolution magnetic encoder and the intelligent driver board mounted on the back, RCM constantly monitors every aspect of its operation, eliminating any missed steps.

#### Closed Loop System

By receiving position input from the sensor, the RCM knows its position and can correct itself.

### **H-Infinity**

Using the newest control technology, the RCM goes beyond static PID control by utilising the robust  $H\infty$ control system.  $H\infty$  responds to dynamic loads across the entire speed range, reduces the need to tune gains and increases the allowable inertia mismatch.

### SMooTH ANd ACCuRATe MoVeMeNTS

The RCM's high resolution encoder gives you exceptionally fine positioning of 50,000 units per rotation. The RCM uses Vector Drive Control to produce extremely smooth motion, even at low speeds, not possible with micro-stepping drivers.

### Vector Drive Control

Vector Drive is a control technique used in servo systems; it is a completely different technique from micro-stepping. Unlike micro-stepping, Vector Drive Control is not subject to resonance problems, produces smooth movements, increases torque and increases efficiency.

### **Reliance Cool Muscle Motor**

### CooL oPeRA TIoN

RCM's power management monitors and provides the optimum current based on load, keeping the motor cool. In addition, the RCM generates high torque at low speeds.

RCM applies optimum current to produce motion, whereas an open loop stepper always uses maximum current.

RCM has high torque even at low speeds and excels at both smooth motion and slow speeds.

RCM only draws power for what it needs, making the RCM power efficient and increasing motor life.

### CoNTRoL

P-type RCM is a drop-in step loss free replacement for a step/direction or CW/CCW pulse drive.

C-type RCM takes ASCII commands or MODBUS RTU from your PC, PLC or can use analogue (joystick) control.

	Control	Variations
₽₽	Pulses	CW/CCW Step/Direction
Р Туре		
Ŷ	PC Embedded Computer PLC Switch	Pre-programmed Dynamic Command
С Туре	Analogue Input	Position Speed

#### FuLLy uSeR PRoGRAMMABLe

Program the RCM to create the motion you need. Define motion profiles and create programs using easy-to-understand RCM Language (RCML). Motion programs you create can be downloaded to the RCM. The programs can be executed via PC, embedded computer or simply using hardware inputs.

### RCML

Reliance Cool Muscle Language allows easy creation of motion programs. Programs can be downloaded to the RCM using free Control Room software available from:

www.reliance.co.uk/en/downloads-motors-and-cables

P1=1000 P2=2000 S1=200 S2=300 A1=50 A2=150 T1=20	Define motion profiles such as speed, acceleration position and timer.
B1 A1,S1,P1 S2,P2,P1 C2 B2 A2,S1,P3	Define motion programs using the motion parameters defined above.

### uSeR deFINABLe PARAMeTeRS

Define the character of your RCM to suit your needs. The RCM gives you over 60 parameters which can easily be set using RCML.

K48=10000 K58=200000 K37=3	•	<ul> <li>Origin offset distance set to 10000 pulses.</li> <li>Software limit + side set to 200000 pulses.</li> <li>Motor resolution set to 1000.</li> </ul>
K46=1 K38=0	•	<ul><li>Automatic home routine using mechanical stopper.</li><li>Sets analogue interface to speed control mode.</li></ul>

### PARAMeTeR exAMPLeS:

### Home Search Method

The home search parameter lets you select a home search method. Home position can be determined using a hard-stop/bumper instead of a home switch. The RCM hits a bumper at low speed and torque and keeps pushing until it reaches a specified current level at which the motor determines that it has reached home. This method eliminates the need for a home switch and wiring.

### Software Limit

Set software limits using RCM parameters. Set limits on both CW and CCW sides, to eliminate switches.

These two software features will save you the cost of three sensors and the time needed to install wiring and calibrate them.

### SoFTWARe INTeRFACe

### Serial Protocol

The PC interface to the Cool Muscle 'Y' Cable is RS232. Cool Muscle serial communications use the ASCII character set. Characters are transmitted with 8 data bits, no parity bit, and one stop bit. There is no hardware or software flow control. The baud rate is selectable from 9600, 19200, 38400 (default) and 57600 baud. The command separator is carriage return or comma. Line feeds are optional and are ignored.

### Register Model

The data memory of the Cool Muscle is divided into families of registers. Each register is labelled by its family (letter) and register number. General parameters and settings are in the K-family. For example register K58 holds the software limit for maximum travel in the + direction in units of 1000 steps. To read the limit, simply send the register name K58 to the motor and it will respond with K58.1=247 if the limit is 247000 steps. To change the limit to 352000 steps, send command K58=352. The K-parameters are non-volatile. If multiple motors are daisy chained together it is necessary to add the motor number to the command, so K58.2 refers to register K58 in motor 2. Each motor can store 25 positions in P-registers P1 to P25, fifteen speeds in S1 to S15, and so on. There are registers for eight accelerations, seven maximum torques, eight dwell timers, and fifteen unassigned registers are volatile, but can be saved into the Cool Muscle controller's EEPROM. The saved values are automatically reloaded into RAM when the motor is switched on.

Technical Information

### **Program Banks**

Up to 15 programs can be stored in the controller EEPROM. Each is a sequence of commands.

B2.5	This is program 2 in motor 5
A3.5,S5.5,M1.5	Load motion parameters from registers
F2.5	Reset OUTPUT 2
X7.5	Start of loop, loop 7 times
P1.5	Go to position in register Pl
T1.5	Dwell for time in register T1
P2.5	Go to position in register P2
T1.5	Dwell for time in register T1
X.5-	End of loop
C3.5	Call program B3.5 as a subroutine
02.5	Assert OUTPUT 2
END.5	End of program
\$.5	Save to EEPROM, motor 5

This program can be started by sending the short command [2.5.

### Logic Banks (PLC Function)

Logic banks are similar to bank programs but are run periodically with a maximum frequency of once every 1ms.

L1.1 I3.1,J2.1 END.1	This is logic bank 1 in motor 1 Test INPUT 3, if set jump to bank 2
L2.1 S.1=S2.1 A.1=A1.1 ^.1 J3.1 END.1	Logic bank 2 Load speed from register S2 Load acceleration from register A1 Activate new speed and acceleration Jump to bank 3
L3.1 I3.1,T0.1,J4.1 END.1	Logic bank 3 Test INPUT 3, if set ignore (TO.1) Otherwise jump to bank 4
L4.1 S.1=S3.1 ^.1 J1.1 END.1	Logic bank 2 Load speed from register S3 Activate new speed Jump to bank 1
\$.1	Save to EEPROM, motor 1

Execution starts in logic bank L1.1. If INPUT 3 is not set, nothing happens until the next periodic run. Then L1.1 runs again.

If INPUT 3 is ever set, a jump occurs. Logic bank L2.1 makes a speed change and control jumps immediately to logic bank L3.1.

Control now remains with L3.1 until INPUT 3 is reset. Then L4.1 makes another speed change and control goes back to the beginning.

The effect is that motor speed is selected using INPUT 3. The speed change is smooth, using the acceleration in register A1.1 and S-curve shaping if parameter K69 is set.

Bank programs and logic banks can both run at the same time, so an ordinary bank program can initiate a motor move and then a logic bank can modify the speed en route.

### More Information

A quick reference card listing all registers and commands is on our website, together with a more detailed programming manual: www.reliance.co.uk/en/downloads-motors-and-cables

### eLeCTRICAL INTeRFACe

The RCM has 4 inputs and 2 outputs that can be used as digital, analogue, serial or pulse counter (input only). RCM lets you assign a different function to each edge and level of a signal.

### Pin Layout

Pin #			
1	+24 V DC IN	Motor power	+24 V±10%
2	0V	Power ground	Note 7
3	INPUT 2-	Return for pin 9	Notes 2, 8
4	OUTPUT 2+	Digital/analogue output, serial Tx	Note 5
5	OUTPUT 1+	Digital/analogue output, serial Tx	Notes 1, 5
6	INPUT 4+	Digital/analogue input	Notes 3, 4
7	INPUT 3+	Digital input	Note 3
8	INPUT 1-	Return for pin 10	Notes 1, 8
9	INPUT 2+	Digital/counter input, serial Rx	Notes 2, 8
10	INPUT 1+	Digital/counter input, serial Rx	Notes 1, 8
11	0V	Signal ground	Note 7
12	+5V DC OUT	Power out	Note 8

### Notes

- Normally used for serial communication with the host PC via an accessory 'Y' or USB cable. In a daisy chain system with multiple motors, used for serial communication with the next upstream, slave or master motor. If the Cool Muscle is being used stand-alone INPUT 1 and OUTPUT 1 can be assigned other functions. These functions are activated when the 'Y' Cable is detached (power off before disconnecting).
- 2. In a daisy chain system with multiple motors, used for serial communication with the next downstream, slave motor. Otherwise INPUT 2 and OUTPUT 2 can be assigned other functions.
- 3. When programmed as a digital input, INPUT 3 and INPUT 4 logic levels are:-HIGH > +3 V (minimum 7 mA) LOW < +0.8 V</p>
- 4. Analogue input range is 0 V to +4.8 V. Resolution is 10-bit (0 1023).
- 5. When programmed as a digital output this signal is NPN, open collector. When programmed as an analogue output the signal range is 0V to 5V. Resolution is 8-bit (0 255).
- 6. Total output current maximum 50 mA.
- 7. Pins 2 and 11 are internally connected.
- When used for STEP/DIRECTION pulse control, INPUT 1 is the step input and INPUT 2 is the direction input. When used for CW/CCW pulse control INPUT 1 steps the motor clockwise and

### **Reliance Cool Muscle Motor**

INPUT 2 steps anti-clockwise. Maximum pulse frequency: 500 K pulse/s Minimum pulse width; 0.8 µs Pulse level high > +3 V (minimum 7 mA) Pulse level low < +0.8 V

### Wiring for INPUT 1 and INPUT 2

These inputs are opto-isolated inputs, minimum 5 V, maximum 24 V. Examples:-

### Wiring for INPUT 3 and INPUT 4

These inputs are internally pulled up to +5 V. To operate them connect to 0 V through a switch or open collector (NPN) output. Examples:-

Controller Reliance Cool Muscle

Technical Information

### Wiring for OUTPUT 1 and OUTPUT 2

Outputs 1 & 2 can work across a range of voltages from 5 V to 24 V. The collector current of the transistor must be limited to a maximum of 100mA.

### AdVANCed MoTIoN

Speeds and accelerations can be changed whilst the motor is in operation. RCM supports a range of advanced motion features such as PTP motion incorporating changing accelerations and variable torque control. The powerful push mode is also standard allowing for electric emulation of common pneumatic operations.

Continuous PTP: There are no stops in motion between origin and P3. Speed and acceleration are changed at each point.

Push Mode: Mimics a typical pneumatic motion. It keeps pushing for a given time and at a set current level when a motor encounters a resistance such as a bumper or stopper.

# Contact us for product information, design support and custom solutions sales@reliance.co.uk +44 (0) 1484 601002 www.reliance.co.uk

### **Reliance Cool Muscle Motor**

### NeTWoRK

RCM provides you with different networking solutions to suit your needs. When multiple RCMs are connected in a daisy chain network, any RCM can tell other motors to activate programs as well as receive commands from a computer or embedded controller.

In fact, after programming, RCMs can operate without any PC, PLC or HMI control.

### ToRQue CoNTRoL ANd FeedBACK

The RCM controller uses the integrated current and position sensors to maintain sophisticated torque control during operation. Peak running torque can be easily set within motion programs, or the built in Push Mode function can be quickly implemented to mimic pneumatic cylinder operations.

### 2-AxIS Co-oRdINA Ted MoTIoN

The RCM servo provides 2 axes contouring utilizing a 2+ motor daisy chain network. Additional linear axes can be implemented on the same motor for applications such as dispensing, cutting, or inspection. Programs can be run directly from the motor without the need for a host controller, or can be streamed from a PC for greater flexibility.

### LOGIC PROGRAMMING ANd PLC FUNCTIONALITY

The RCM real time operating system precisely controls I/O timing allowing for PLC style I/O operation. Logic banks provide a flexible logical and mathematical capability analogous to that offered by traditional ladder logic. User defined actions can be triggered by external inputs or by internal motor conditions such as speed, torque, or position.

### RACK ACTuAToR

### Installation

Each Racktuator<sup>™</sup> is supplied pre-assembled with carefully set clearances and alignments. Disassembly may result in reduced performance and accuracy. The rack should not be removed from the housing to avoid possible damage to teeth when it is re-inserted.

### Axial load rating

The axial load rating is dependent upon the rack, pinion and motor. As a general guide the load ratings in the product data pages (see pages 2-15 to 2-17) can be used to determine the allowable rack thrust.

**Basic Ratings:** 

- For axial thrust loads of up to 3 N use a RCMRA17-6-250 tubular rack (see page 2-15) with a PEEK pinion
- · For axial thrust loads from 3 N to 20 N use a stainless steel pinion in lieu of PEEK pinion
- For axial thrust loads from 20 N to 90 N use the RCMRA23L (see page 2-16), which utilises a 17-4 PH stainless steel pinion and hardened stainless steel rack

#### Position accuracy and side wobble

Positioning accuracy depends on the resolution of the motor and the drive system. For the RRA series the full step size of the motor is 1.8° which translates to 0.2 mm of linear motion of the rack. Finer positioning may be achievable with a half-stepping or micro-stepping drive. For the RCMRA series where the angular resolution is 0.0072° the linear resolution is 0.0008 mm, depending on load and dynamic conditions.

Side wobble is dependent upon initial clearance between rack and bearing bore, the length of rack and wear between the rack and plain bearings. For RRA17-6-250 (see page 2-15) the maximum side wobble is ±0.2 mm at end of the rack with maximum protrusion from the housing.

#### Backlash

This is currently set on assembly between 0.020 mm and 0.060 mm axial clearance of the rack. It is possible to improve this on assembly and also reduce the rotation of the rack in the clearance, please contact us. It is not advisable to reduce backlash to zero as pinion eccentricities and temperature variations could cause binding. A temperature rise of approx. 35°C would be needed to cause possible binding of rack and pinion when a backlash of 0.010 mm is set.

#### Lubrication

PEEK pinion and stainless steel racks require no lubrication. Stainless steel racks and pinions require a smear of a lithium based grease on to the rack teeth for periodic lubrication.

**Technical** Information

### RACKTuAToR™ STePPeR MoToRS

Stepper motors operate by rotating the motor shaft at discrete intervals (1.8° for our steppers) as they receive electrical input pulses. This basic characteristic distinguishes stepper motors from other motors and makes them ideal for applications where accurate positioning and control is required, without the need for expensive feedback hardware.

### Features of stepper motors

Position holding - (Detent torque)	Even with no power applied to the windings, stepper motors will resist rotation, which may be useful in applications that would normally experience 'drift'. If power is applied, this holding torque is significant.
High acceleration -	They have excellent acceleration performance that allows a start, stop and reverse to be performed at relatively high speed.
Good reliability -	The only components subject to wear are the bearings, as there are no brushes or commutators.
Low component count -	Stepper motors permit open-loop, high precision positioning control, therefore feedback hardware for control is not required, which leads to low cost system design.

### Drive methods

There are three main modes of driving a stepper motor - Full Step, Half Step and Micro Step. With Full Step, the angular movement is the basic step angle, ie 1.8°. By manipulating the energisation sequence applied to the motor, it is possible to reduce the basic step angle by half. By manipulating the shape of the pulses applied to the motor, as well as the energisation sequence, the basic step angle can be split into several hundred micro steps. This large increase in resolution can only be achieved by using more complex drive electronics.

There are a number of methods of driving stepper motors, that basically divide into two groups; unipolar and bipolar drives. In unipolar drives the current always travels through the windings in the same direction. This is often achieved by attaching one end of each winding to a fixed voltage supply rail. With bipolar drives the current travels in both directions, which can give benefits in performance, although it usually requires more switching components. In both cases additional components such as resistors are often used to adapt a drive to a specific motor or to modify the characteristics of the motor-load system.

Our Racktuator<sup>™</sup> stepper motors have 6 wires, which allow the user to chose between unipolar and bipolar drives. Steppers with less wires do not.

The design and implementation of a suitable drive for a specific application can be quite an involved process and is outside the scope of this technical section. For further advice please contact Reliance Technical Sales.

### **Technical information**

Insulation parameters	Dielectric Strength: 500 VAC Insulation Class: Class B
Insulation resistance	100 MΩ min. (at 500 V DC)
Dielectric strength	500 V AC (1 minute)
Operating temperature range	-20°C to +50°C
Permissible temperature rise	80°C max. (resistance method)

Note: Do not allow the surface temperature of the motor case to rise above 90°C during operation.

### Installation - connections

Size 17 steppers have 200mm cables with a EHR-6 connector (JST). Mating parts are available from RS components; top entry (stock no 515-1434) or side entry (stock no 515-1349).

# epicyclic Modules

### ToRQue CuRVeS

### ouTPuT SHAFT ToRQue

This is derived from an eight hour day, continuous unidirectional drive and no impact fluctuating load.

### PeAK ToRQue CAPABILITy

Momentarily allowable torque is 250% of rated torque (under the same conditions as output torque).

### dyNAMIC LoAd FACToR

The rated torque has been derated in accordance with the following table:

Dynamic	Load	Factor	(Sf)
---------	------	--------	------

drive	driven	Load Type				
		uniform	Medium Impact	Heavy Impact		
	Hrs/day	Sf	Sf	Sf		
Electric Motor	<3 3 - 10 24	1.0	1.0 1.25 1.5	1.5 1.75 2.0		

Allowable Torque = <u>Rated Torque</u> Sf

### **ReVeRSING Motion**

Should MEMs be used in a reversing drive (eg. servo application) the units should be derated to 80%.

### TeMPeRATuRe RANGe

The unit will operate satisfactorily between -10° and +65°C. For the all metal units, maximum temperature is 75°C.

### MouNTING PoSITIoN

The standard position is horizontal. For other planes, please contact our sales team for more information.

### ReQuIReMeNTS FoR ASSeMBLING uNITS

1. Alignment - Radial alignment errors, after fitting the input and output shafts, should be within 0.15mm.

2. Location of Internal Gear - A unit should be located in the manner in which the torque distribution is uniform in the internal gear.

3. Clearance - Axial clearance between the unit's revolving parts (Carrier A & B) and casing should be 2mm to 4mm.

4. Thrust Support when Mounting Vertically - When mounting the units with shafts vertically, care must be taken to ensure that the mass of the module is supported by the shaft bearings and not the planet disks containing the internal gear. If the unit is mounted with the output shaft uppermost, then a shoulder will be required on the input shaft and vice versa.

5. Lubrication - For grease lubrication the casing should be filled with grease to between 50% and 80% of the volume and for oil lubrication to between 30% and 50% of the volume.

### oVeRHANG LoAd (oHL) - kg

The overhang load is a bending force acting on the shaft generated by external forces.

Calculate the OHL according to following equation and select an appropriate bearing:

T : Driving torque

R : Pitch circle radius of gear or sprocket

Ef : Element factor:

Gear	1.1 - 1.25
Sprocket	1.25
Flat Belt	2.5 - 3.0
V Belt	1.5 - 2.0

## epicyclic Modules

### **NoTeS FoR HANdLING**

1. Plastic Unit P - Lubricated with grease when assembled. (Units without grease lubrication are special to order).

2. Sintering Alloy Unit S - Not lubricated with grease when assembled. (Units with grease lubrication are special to order).

- 3. Metal Unit M Not lubricated with grease or oil.
- 4. Do not mix strong acid or oil additives and thinners to the lubricant of the plastic units.
- 5. Do not allow rapid temperature variations. This will generate moisture.
- 6. Store the MEM units in a dark room below 40°C and keep in a dry, dust-free atmosphere.

7. If a unit is mounted on a surface which acts as a sounding-board, the noise will be amplified above the inherent noise level of the unit. Take care when mounting the unit.

### HouSed uNITS (LGH)

MEM modules can be supplied mounted in an aluminium housing complete with output shaft and support bearings. The complete unit is rated at 10Nm output torque, and can have either one, two or three modules. Maximum reduction ratio is 125:1 with 3x5:1 ratio modules. The accompanying motor must have a 'D' shaped shaft of 8mm diameter and 7mm over the flat.

Also included is the MEM26. This is a housed unit complete with input and output shaft. Actual ratio is 91.125:1 and the unit is capable of handling 2 Nm output torque.

Larger modules are available up to 1000 Nm output torque. Please enquire.

### GeAR MANuFACTuRe

Reliance's precision instrumentation gears are manufactured using high accuracy gearcutting equipment. Standard gears are produced in stainless steel, hardened stainless steel, aluminium alloy and brass (wormwheels only). Alternative materials such as PEEK polymer or Delrin are available on request.

### GeAR ToLeRANCeS

Gears are generally offered as Quality 10 (see the individual product pages). Higher qualities are available as shown in the table below. Most gears in the catalogue can be produced in these qualities to order.

Reliance standard tolerances are largely based on AGMA 390-03 backlash.

Reliance S	Reliance Standard Gear Qualities Table values in 0.001mm (0.0001"								m (0.0001")
Quality Class	Modular Range	TotalTooth to ToothCompositeCompositeerrorerror		Indicator Limits Gauge zeroed at std. pitch rad.			Gear Quality

### ReLIANCe GeAR STANdARdS FoR FINe PITCH GeARS

The table below is a comparison between Reliance (AGMA) and equivalent UK specifications:

\*AGMA values quoted are for over 20T up to 50 mm (2") diameter. Admiralty and B.S. tooth to tooth errors are for over 30T.

† Minimum indicator level 0.006" or 0.15 mm.

For numbers of teeth outside the range consult the relevant specification.

### STANdARd ModuLeS ANd CIRCuLAR PITCHeS - MeTRIC

Reliance's precision instrumentation spur gears are available as standard in the following modules and circular pitches, being those most commonly used in the design and manufacture of gear control mechanisms and instruments:

Module 0.2, 0.25, 0.3, 0.4, 0.5, 0.6, 0.8, 1.0, 1.25, 1.5 Circular pitch 1, 2, 2.5, 3

#### Pressure Angle and Rack Form

Except where stated otherwise, gears in this catalogue are cut to 20° pressure angle involute form teeth. Reliance standard gears will mesh satisfactorily with gears of the same module cut to the following standards:

- (i) BS 4582 (1970) Part 1, Figure 1.
- (ii) DIN 867 and 58412.
- (iii) AGMA 207.06 (Assuming the pitch is cut to an equivalent module).

The gears will not mesh satisfactorily with gears cut to DIN 58400 unless the outside diameter of the latter is reduced to PCD + (2 x module).

DIN 58400 tooth proportions are:

Addendum	1.1 x Module
Dedendum	1.5 x Module for pitch 0.1 to 0.6 Module

Metric To	Metric Tooth Proportions (Dimensions in mm)						
Module	Circular Pitch	Addendum	dedendum	Working depth	Whole depth	equivalent Inch diametral Pitch

Acetal	Delrin 150		Hubless gears	D1	

### Finishes

Stainless steel, bronze and brass gears remain in their natural condition. Passivation to DEF STAN 03-2, process M can be carried out if required. Aluminium components are anodised to specification DEF STAN 03-24 (chromic acid process) or DEF STAN 03-25 (sulphuric acid process). Gear teeth are not normally anodised.

#### Anti-backlash Gears

Materials and finishes of standard anti-backlash gear components.

Where possible circlips, anti-backlash springs, shims and set screws will be stainless steel. However, some smaller pinions may have beryllium copper or zinc plated carbon steel circlips as standard.

### GeARS WITH SMALL NuMBeR oF TeeTH

Unless otherwise requested, all gears in this catalogue having 16 teeth or fewer will be enlarged by applying addendum modification in accordance with BS4582 Part 1 (metric) as shown in the table below. These gears are indicated (†) against the appropriate tooth numbers on the product pages.

A small amount of backlash will be introduced between corrected pinions and mating gears when the modification sum is other than zero and the nominal centre distance is adjusted only by an amount equal to the modification sum.

For minimum backlash it will be necessary to either reduce the centre distance further, or to apply a secondary correction to the pinion or wheel. See the above B.S specification for details.

X = Uncorrected PCD Y = Corrected PCD

Find P.C.D. and O.D. o	f enlarged gear having 13 teeth, 0.6 module	
	P.C.D. =13.4794 (from table) x 0.6 module	=8.088 mm
	(Standard P.C.D. would be 13 x 0.6	=7.800 mm)
Similarly,		
	O.D. =15.4794 (from table) x 0.6 module	= 9.288 mm
	(Standard O.D. would be 7.8 + (2 x 0.6)	= 9.00 mm)

Note:

For Imperial (diametral pitch) gears, divide the PCD or OD value in the table by the diametral pitch. The answer will be in inches.

Technical Information

### eNGINeeRING dATA

For instrumentation Reliance normally recommend stainless steel pinions mating with aluminium alloy gears. Generally the pinion is subjected to most wear since it experiences a higher number of stress cycles than the wheel. This combination of materials tends to balance the wear between the pinion and the gear.

### 1. Gear Materials

#### Stainless steel

The 300 series stainless steels are used for gears when maximum corrosion resistance is required. They are 'true' stainless steels containing 18% chromium and 8% nickel.

Gears made from 303 stainless steel are essentially nonmagnetic and cannot be hardened by heat treatment. They are recommended for low torque applications as their mechanical properties and resistance are low.

### Hardened stainless steel

17-4PH is a precipitation hardening stainless steel that offers a remarkable combination of high strength and hardness. Its high chromium content (15-17.5%) makes it an excellent material for arduous environments.

#### Aluminium alloy

Gears made from aluminium alloy are widely used in measuring applications. Its light weight offers reduced inertia. The inertia of an aluminium alloy gear is approximately 35% that of a steel gear. In particular, aluminium alloy L168 offers excellent corrosion resistance when anodised, moderately good mechanical properties and good stability.

### Phosphor bronze

As a gear material phosphor bronze has a fine grain and good resistance to tooth sliding wear hence its use as a worm wheel material.

### 2. Installation

Gears in this catalogue are designed to be a slide fit on the shafts. The gears are available with four fixing methods: standard clamp, pins, set screws and Reli-a-Grip™ clamp.

Traditional clamp hub style gears have a gear hub with a relatively thin wall partially split. The clamp is a close fit on the hub and is compressed when the clamp screw is tightened. Clamping gears onto the shaft offers extremely easy assembly with the best assembled accuracy. However, as the fastening depends upon friction it can only be used in low torque applications.

Pin type gears are supplied as standard with a set screw and a sub-drilled hole. The set screw should be used to position the gear on the shaft during the drilling and pinning operation and can be removed once the gear is secure.

The sub-drilled hole provides a lead in for the drilling operation. It is recommended that drilling and pinning is completed outside the gearbox and the gear is thoroughly cleaned afterwards.

In less critical applications the set screw may be used to retain the gear on the shaft. To avoid damaging the shaft and to make removal of the gear easier the set screw should seat on a small flat, or dimple on the shaft.

### 3. Lubrication

All gears should be lubricated, but there are variations in degree.

Highly loaded precision gears should be in enclosed assemblies with complete lubrication to obtain the best possible hydrodynamic film. The system can be splash, spray or force fed, depending on the application. Moderately loaded precision gears, such as fractional horsepower systems, should be enclosed with oil or grease lubrication which can be spread by splash or dip lubrication.

Lightly loaded gears in instrumentation systems only need to have a marginal boundary lubrication as provided by periodically wiped on oils or grease. In many instances a light coat of Rocol MT LM or similar molybdenum disulphide grease will suffice for the life of the system. Anti-backlash gears should not be directly lubricated except via a very light application on the mating pinion.

Negligibly loaded fine instrument gears only need a brushed on film of light oil as a simple means of reducing friction.

### 4. Speed

The maximum pitch line velocity for stainless steel meshing with aluminium alloy with boundary lubrication is approximately 5,300 mm/sec (for a pair of meshing actuation gears correctly lubricated, this rises to approximately 8,000 mm/sec). This represents 5,000 rpm on measurement gears of 20 mm diameter (and 7,500 rpm on actuation gears of 20 mm diameter).

For speeds in excess of this and other material combinations please consult Reliance technical sales.

### 5. Gear Loading

The gears in this catalogue can be used for both feedback and actuation systems. The loads and material selection will depend on the application. In general a feedback system is designed to maintain accuracy and an actuation system is designed to transmit power.

### 5.1. Actuation Gears

The following analysis is intended to give a guide to the load capacity of a pair of spur gears. To simplify the calculations, a number of assumptions have been made. It must be noted that in many applications this will give a conservative estimate of the gear capacity, therefore, in critical applications an exact analysis must be completed.

Please consult the relevant gear standards or Reliance Technical Sales.

The analysis is based on AGMA 2001-B88 and assumes the following:

- 1. The gears are simply supported in rolling element bearings.
- 2. Pinion revolutions >10<sup>7</sup>.
- 3. Gears are grease lubricated.
- 4. Reliability of 1 failure in 100 is acceptable.
- 5. Gear material is 17-4PH hardened.

### **Standard Gears**

**Technical** Information

The basic load capacity (F<sub>b</sub>) of a pair of spur gears is defined as the maximum tangential force at which they can operate indefinitely.

 $F_b$  has two values: one calculated from tooth root strength ( $F_{bs}$ ), and one for tooth flank pitting ( $F_{bw}$ ). The useful or transmitted load capacity,  $F_t$ , is usually less than  $F_b$  due to transient or dynamic loads generated within the mechanism.

For tooth root strength	Fts = Fbs/Ka	Ka & Ca = Application factors
For tooth flank pitting (wear)	Ftw = Fbw/Ca	

Both calculations should be made and the lower value used.

The application factors  $K_a$  and  $C_a$  make allowance for any externally applied loads in excess of the nominal tangential force  $F_b$  and they are most accurately determined by direct measurement. In determining application factors, consideration should be given to the fact that many prime movers develop momentary peak torques appreciably greater than those determined by the nominal ratings of either the prime mover or the driven equipment. There are many possible sources of overload which should be considered including system vibrations, acceleration torques, overspeeds, variations in system operation and changes in process load. Impact loads due to reversing across backlash can be significant in servo systems.

As a general guide application factors for a motor gear system range from 1.0 for uniform loads up to 1.75 where heavy shock loads are anticipated.

For strength Fbs = 177.7 x J x F x M x Kv		Fb = Basic load capacity (Fbs & Fbw) N = Number of teeth
		J = Geometry factor, strength
		I = Geometry factor, wear
For wear $F_{bw} = 14.64 \times N \times I \times F \times M \times K_V$	[N]	F = Face width of smallest gear
		M = Module
		K <sub>v</sub> = Dynamic factor

(i) Number of teeth

This is the number of teeth in the gear being analysed.

(ii) Geometry factors, I and J

These factors take account of the effect of tooth proportions on stress. The bending strength geometry factor, (J) takes account of the shape of the tooth. The wear resistance geometry factor, (I) takes account of the radii of curvature of the contacting tooth profiles. Please see the graphs on page T4-13.

(iii) Face width, F

This is the face width of the smallest gear in mm. (Face width in contact).

(iv) Module, M

This is the gear module expressed as shown on the respective gear pages.

(v) Dynamic factor, Kv

This accounts for internally generated gear tooth loads which are induced by the non-conjugate meshing action of the gear teeth.

Technical Information

### **Standard Gears**

For quality 10 gears only Vt = Pitch line velocity (m/s)

Example calculation to find the theoretical load capacity of a 5:1 pass of 17-4PH spur gears as follows:

Pinion - P06S8B6F4A-25 Gear - P06S8B8F6A-125 Pinion speed is 500 rpm.

(i) Number of teeth from part number = 25

(ii) Geometry factors from graph

(iii) Smallest gear face width from part number

(iv) Gear module from part number

(v) Dynamic factor from equation

Fbs = 177.7 x 0.37 x 4 x 0.6 x 0.96 = 151.5 N

Fbw = 14.64 x 25 x 0.118 x 4 x 0.6 x 0.96 = 99.5 N

For alternative materials the above values need to be modified as shown below:

Gear Material Modification Factors					
Material Specification Strength Wear					
Hardened stainless steel	17-4PH	1.00	1.00		
Stainless steel	303S31	0.43	0.15		
Stainless steel	316S31	0.47	0.20		
Aluminium alloy	L168	0.37	0.10		
Brass	CZ121	0.35	0.13		

### **Standard Gears**

Example:

If the gears in the example on the previous page were made from 303S31

The application factors should be applied after the reduction for material.

### 5.2. Instrumentation and Feedback Systems

Gears and components designed for the precise transmission of angular position generally work at the low torque levels normally associated with servo components such as synchros, resolvers, optical encoders etc. Tooth loads of 1.2 N per mm face width should result in an adequate accurate life. Higher loads will tend to increase deflections of gear teeth, shafts, bearings etc, resulting in significant values of lost motion and a decrease in life.

Example: To find the maximum advisable torque on a gear 40 mm diameter x 3 mm face width.

Torque = force x radius =  $1.2 \times 3 \times 0.04/2 = 0.072 \text{ Nm} (10 \text{ oz.in.})$ 

### 5.3. Anti-backlash Gear Spring Tension

In order for anti-backlash gears to function as anti-backlash devices, it is necessary to ensure that the spring tension will provide sufficient torque to overcome the friction and acceleration torque in the system, ie the spring torque must be capable of driving/accelerating the gear train and any associated components.

The spring tension capability of anti-backlash gears listed in this catalogue will adequately cope with the low torques normally encountered.

As a general guide, torque settings on anti-backlash gears of 1.059 to 1.765Ncm (1.5 to 2.5 oz.in.) will suffice in most applications. Ideally the spring torque should be set to the minimum at which the anti-backlash gear performs satisfactorily, thus avoiding unnecessary high preload on the gear teeth and premature wear.

### 6. Lost Motion and Backlash Control

The following section deals with lost motion, which we know to be one of the basic problems in designing fine pitch gear trains. The accepted definition of lost motion is the amount by which the output shaft may be turned without turning the input shaft.

It may be thought that lost motion is a function of the gear cutting operation alone, but, in fact the teeth of the gears may contribute very little to the overall lost motion value. A complete understanding of all the elements which induce lost motion is essential in order to achieve a well designed gear train. The following factors must be individually considered for their own contribution to overall lost motion in the gear train:

- (a) Nominal centre distance.
- (b) Centre distance tolerance.
- (c) Size and tolerance of mating gears.
- (d) Total composite error of gears.
- (e) Fits between bores, shafts and bearings.
- (f) Bearing accuracy (class).
- (g) Radial play of bearings.
- (h) Shaft straightness and alignment.
- (i) Fits between electrical and/or mechanical component spigot diameters, and housing bores.
- (j) Eccentricity and radial play of electrical and/or mechanical component shafts.
- (k) Torsional elasticity.

T4-14

(I) Differential expansion.

**Technical** Information

Each of the previous, except nominal centre distance, tend to induce a change in centre distance which will push together or pull apart the mating gears. This push-pull action produces two backlash values, minimum at the point of the tightest mesh, and maximum at the point of loosest mesh.

(a) Calculation of Nominal Centre Distance

Nominal centre distance can be considered as the starting point in the calculation of overall backlash values. Nominal centre distance is calculated by taking half the sum of the (theoretical) pitch diameters of the mating gears.

(b) Centre Distance Tolerance

Centre distance tolerance is an extremely important area for consideration. Any increase in centre distance in excess of the nominal value will increase the backlash. A decrease in nominal centre distance will decrease the backlash. In this case caution must be exercised to avoid interference between mating gears as a result of this decrease.

The relationship between centre distance change to backlash for 20° PA spur gear is given by:

$B = 2 Tan \emptyset \cdot \Delta C$	where	B = Circumferential backlash
		ø = Pressure angle (Tan 20° = 0.36397)
		$\Delta C$ = Distance between theoretical nominal
		and actual centre distance

Note: Maximum Angular Backlash = <u>Maximum Circumferential Backlash x 57.3 x 60</u> (minutes of arc) Pitch Circle Radius

#### 7. Gear Error

The error function of a gear is approximately sinusoidal and for practical considerations can be assumed to be so. The first derivative of the time displacement curve yields the velocity function, therefore, the output velocity variable will also be an approximate sinusoid but the maximum velocity error will be displaced 90° from the maximum position error.

In summation, pitch circle runout will cause a sinusoidal error which is revealed as an output transmission error when meshed with a mating gear. The magnitude is given by the following example:

In the example on page T4-16, if the small pinion were not a perfect gear its error would be seen superimposed on the large gear error cycling at pinion frequency.

#### 8. Transmission Accuracy of Gear Trains

The following section is based on work carried out by Reliance Gear Company (now known as Reliance Precision Limited) to provide some guidance in the design of accurate data transmission gearing.

The transmission error referred to by equations 1 and 2 below represent the maximum statistical point to point error during a forward and reverse cycle of a single pass of quality 14 anti-backlash gearing assembled in a data transmission gearbox.

For quality 10 or 12 gearing add 50% or 30% respectively to the error calculated for quality 14 gearing.

For average transmission error substitute the numbers 3.25 and 83 in the equations for the numbers 4.4 and 112 respectively.

T4-16

### BACKLASH FoR STANdARd GeARS

The table below refers to the allowable backlash within the range of Spur, Bevel, and Worm gear pairs with a designated centre distance. The allowable backlash is necessary to absorb the deviations of noise and oscillation in order to maintain smooth operation.

Gear Type	Condition	Module (m)	Backlash (mm)
	Brass/ Ground	< 0.9	0.02 - 0.06
Spur Gear	Brass	0.9 to 0.75	0.04 x m - 0.10 x m
	Ground	0.9 to 1.0	0.04 x m - 0.08 x m
Boyol Coor pair	Bevel Gear pair Stainless steel or Brass		0.02 - 0.08
Devel Geal pail			0.05 - 0.12
Worm Gear pair Centres < 50 mm	Worm - Stainless steel Worm wheel - Brass	≤ 1.0	0.08 - 0.20

Note. These figures apply to the standard gear range only. To convert Circumferential Backlash to Angular Backlash see page T4-15

#### **RACK MANuFACTuRe**

Reliance standard precision racks are produced by a thread grinding process, which generates teeth of helicoidal form. This provides two distinct advantages: very good pitch accuracy and sufficient tolerance of meshing conditions (within 0.25°) to make high precision alignment of the pinion unnecessary.

This feature will be appreciated from the diagram below. Slight misalignment of the straight-tooth pinion, in terms of deviation from a true right-angle between the axis and rack in either plane, results merely in a change of position of the contact points across the face.

#### RACK STANdARdS ANd ToLeRANCeS

Reliance precision racks are offered in four basic grades of accuracy through most of the range, please see the individual product pages for details. Grade 4b has been introduced to offer a lower cost grade 4 where a single rack is to be used in a non-butting application.

The tooth form is generally in accordance with BS 4582 part 1. fig 1. for metric racks.

Rack Grade	5	4	4b	3	2	1
Max pitch error between any two points per 300 mm of rack	0.005	0.008	0.008	0.015	0.025	0.050
Max end to end pitch error up to 300 mm of track*	±0.004	±0.004	±0.008	±0.008	±0.013	±0.025
Adjacent tooth error	0.0025	0.0025	0.0025	0.005	0.010	0.013

\* Applies pro rata to length >300 mm

All dimensions in mm

#### eNGINeeRING dATA

#### 1. Linear Speed

Linear speeds of up to 10 m/s can be achieved with correctly installed rack and pinion systems. When specifying a system, care needs to be taken to ensure that the transducer count rates are not exceeded. With grease lubrication, care should be taken to ensure that the lubrication is not thrown off the pinion

#### 2. Load Capacity

The following analysis is intended to give a guide to the load capacity of a rack system. To simplify the calculation a number of assumptions have to be made. In many applications this will give a conservative estimate of the gear capacity, therefore in critical applications an exact analysis must be completed. Please consult the relevant gear standards or Reliance Technical Sales.

The basic load capacity (Fb) of a rack and pinion is defined as the maximum linear force at which they can operate indefinitely.

 $F_b$  has two values: one calculated from tooth strength ( $F_{bs}$ ) and one for tooth flank wear ( $F_{bw}$ ). The useful or transmitted load capacity,  $F_t$ , is usually less than  $F_b$  due to transient or dynamic loads generated within the mechanism.

 $\label{eq:constraint} \begin{array}{ll} \mbox{For tooth root strength} & \mbox{Fts} = \mbox{Fbs}/\mbox{Ka} & \mbox{Ka}\mbox{Ca} = \mbox{application factors} \\ \mbox{For tooth flank pitting (wear)} & \mbox{Ftw} = \mbox{Fbw}/\mbox{Ca} \end{array}$ 

Both calculations should be made and the lower value used.

300

250

200

Information

The previous graph has been calculated in accordance with AGMA 2001-B88 for a life of at least 10<sup>8</sup> load cycles, and a rack hardness exceeding 50 HRc and pinion material 17-4PH. For alternative pitches and materials the graph values need to be modified as shown in the table below:

Pitch and Rack/Pinion Material Modification Factors							
Rack	Pinion	Pitch (mm)	Strength	Wear			
	17-4PH	1	0.50	0.50			
Hardened Round Rack (hardness>50 HRc)	316	1	0.23	0.10			
	PEEK polymer	1	0.04	0.01			
		1	0.38	0.28			
	17-4PH	2	0.75	0.56			
		2.5	0.94	0.70			
Rectangular Rack (hardness 35-45 HRc)		1	0.23	0.10			
	316	2	0.47	0.20			
		2.5	0.59	0.25			
	PEEK polymer	1	0.04	0.01			
Takadan and Daamd	17-4PH	1	0.23	0.10			
Tubular and Round Rack	316	1	0.23	0.10			
	PEEK polymer	1	0.04	0.01			

Example:

A 40 tooth, 1 mm CP pinion material 316 meshing with rack of hardness <50 HRc. The application factors should be applied after the reduction for material and pitch.

F<sub>bw</sub> = 175 x 0.10 =17.5 N F<sub>bs</sub> = 170 x 0.23 = 39.1 N

#### 3. Bearing Capacity

When linear bearings are used with the hardened round bar racks the capacity of the support bearings needs to be considered. Where possible the bearings should be positioned with all the ball rows running on the rack shaft. However, it is important that the balls do not run on the edges of the teeth. If necessary the 5 and 6 row bearings can be used with 1 row above the teeth. In this scenario, the manufacturer's ratings apply with a modification for the direction of the load application. The factors given in the following charts should be substituted for the bearing manufacturer's load reduction.

#### Closed bearing 5 rows of balls

#### Closed bearing 6 rows of balls

#### 4. Lubrication

Lubrication is not required when using PEEK polymer pinions. For other combinations unlubricated systems are not recommended. Measurement applications should use a very thin coat of light oil, in many machine tool applications stray cutting oil is sufficient. Grease lubrication is recommended for higher loads, but care should be taken to ensure the lubrication is not thrown off the pinion at speed.

#### **INSTALLATION**

The installation techniques differ according to the type of rack. All racks should be mounted with teeth pointing downwards wherever possible so that dust etc cannot settle in them.

#### 1. Soft Round and Tubular Rack

Plastic moulded bearings are recommended for use with soft round and tubular racks, these can be found in the Bearings and Spacers section of the Reliance catalogue. Round racks are not recommended for multi-section use.

#### 2. Hardened Round Rack

Bearings for the round bar rack should be fitted in accordance with the manufacturer's instructions. It is important that the balls do not run on the edge of the teeth. Round racks are not recommended for multi-section use.

#### 3. Rectangular Rack

Reliance rectangular section rack is manufactured to enable butting to form infinite lengths. Socket head cap screws, plain washers and a thread locking adhesive are preferred for mounting. Dowels are not recommended. The pitch line of the rack in its constrained position must be straight to obtain maximum accuracy. To avoid distortion, racks should be screwed to a machined flat surface.

Machining requirements for rack location

- 1. Pinion clearance
- 2. Clearance required if:
  - a) anti-backlash pinions are used b) full face of rack is to be used
- 3. Abutment
- 3. Abutment 4. Mounting fo
- Mounting face

To align racks, two adjustments need to be made, pitch line alignment and pitch adjustment. The pitch line straightness is not critical (see drawing below) but steps at the joints should be avoided as they can lead to excessive noise and wear.

- 1. Pitch line alignment
- 2. Pitch adjustment and error compensation

#### Pitch Line Alignment

There are three methods of setting the pitch line at a joint. These are:

- i) Setting the base of the racks against an abutment perpendicular to the mounting face. The misalignment is then governed by the rack pitch line to base tolerance.
- ii) Using the tops of the rack teeth as a reference. These are parallel to the pitch line within 0.008 mm. Use a short straight edge (eg. slip block) as shown below.
- iii) The best measurement of the pitch line is with the pinion installed on a flexplate. A dial indicator fitted as shown gives a direct reading of the pitch line straightness.

Pitch line alignment using slip block

Dial indicator carried with flexplate

The flexplate spring loads the pinion into mesh on both flanks of the teeth, ensuring complete backlash elimination.

#### Pitch Adjustment and Error Correction

Pitch accuracy can be obtained by one of three methods depending upon accuracy required.

GRADE 1 (and for the initial setting of all grades)

For pitch accuracy across the joint of ±0.020 mm the Rack Setting Piece is the simplest method.

#### GRADE 2, 3 or 4

After initial setting and with the measuring system functioning, length bars may be used as references. Checks made against these allow adjustment to be made within the system resolution.

#### GRADE 3, 4 or 5

After initial setting and with the measuring system functioning, comparison should be made with a laser measuring system. This allows pitch adjustment and machine error compensation within the system resolution over the full travel of the axis.

#### **RACK APPLICATIONS**

Reliance precision racks are manufactured in both round and rectangular sections, and can be used for both measurement and actuation. In general the smaller pitches (1mm) are ideal for measurement, as the smaller pinion diameter gives higher linear resolutions. The larger pitches (2 mm and 2.5 mm) allow a higher load capacity.

For most applications the rack can be used for both the feedback and the actuation. In very precise applications we recommend that an unused section of the actuation rack is used for feedback. Alternatively a separate rack can be used.

All Reliance racks are calibrated to measure correct at 20°C using a temperature compensated laser. Calibration graphs can be supplied if required.

#### RACK ACTuAToR

Information about the Racktuator™ is provided on page T2-9.

#### FeATuReS

Reliance's precision leadscrew assemblies are designed specifically for motion control applications where accuracy must be maintained. Rather than being adaptations of general purpose screws or nuts they have a precision rolled screw thread which has been designed for maximum life and quiet operation.

A further enhancement available on stainless steel leadscrews up to 2.4 metres long is a specially formulated TFE coating which can extend normal nut life by up to 300%.

Innovative anti-backlash nut designs provide assemblies which are wear compensating with low frictional drag torques and excellent positional repeatability.

Reliance stainless steel leadscrews offer the following:

#### 1. High Accuracy

Precision thread rolling process provides a standard lead accuracy of 0.0006 mm/mm. Higher accuracies up to 0.0001 mm/mm can be provided. The unloaded repeatability of anti-backlash assemblies is within 0.0013 mm.

#### 2. Long Life

More than 7.5 million metres of travel can be expected.

#### 3. Low Drag Torque

An anti-backlash nut design which does not require high spring forces to maintain bi-directional antibacklash characteristics gives very low nut to screw friction.

#### 4. Low Maintenance

Self lubricating and wear compensating nuts eliminate the need for repeated lubrication or adjustment.

#### 5. Wide Range

Diameters from 3.2 mm to 24 mm. Leads from 0.30 mm to 92 mm. Lengths up to 4 metre.

#### 6. Custom Thread Design

Unique thread form designed specifically for leadscrews in anti-backlash applications.

#### 7. Smooth Quiet Operation

No recirculating ball noise or metal to metal contact.

#### 8. Lower Cost

Less than comparable ball screws or ground leadscrews, while still providing high accuracy and long life.

#### 9. Modifications

Special leadscrew ends and other leads are available on the stainless steel leadscrew range in selected sizes. Please contact Reliance Technical Sales or refer to the leadscrews modification section of this brochure.

**Technical** Information

#### eNGINeeRING dATA

#### 1. Lead

The lead of the screw is the amount of linear movement of the nut for one revolution of the leadscrew.

#### 2. Drive Torque

The required motor torque to drive a leadscrew assembly is the sum of three components: inertial torque, static friction torque and torque to move the load. Additional torque associated with driving and supporting the leadscrew must also be considered.

Inertial torque:		Inertia of leadscrew (kgm²) Angular acceleration (rads/s²)		
Static friction torque:	torque of 0.007 - 0.05 N	s are typically supplied with a static frictional n. Higher pre-load forces lead to higher frictional nti-backlash characteristics.		
Torque to move load:	The torque to move a certain load is a function of the lead and efficiency of the leadscrew assembly.			
	Torque = $\frac{\text{Load x Lead}}{2\pi \text{ x Efficiency}}$	Torque = Newton metres / Load = Newtons Lead = Metres		

(Note - efficiency of 70% would require 0.7 in these equations)

#### 4. Backdriving

In general when the screw pitch is less than 1/3 its diameter and the screw is uncoated, backdriving will not occur. (Coated screws require to be 1/4 diameter). For higher leads where backdriving is likely, the torque required for holding a load is as follows:

Backdrive torque = Load x Lead x Efficiency	Torque =	Newton metres
2π	Load =	Newtons
	Lead =	Metres

Small vibrations in the system may break the static friction initiating backdriving, therefore, for small critical applications use smaller lead or an external locking device.

#### 5. Traverse Speed

The polyacetal nut materials provide long wear-life over a wide variety of conditions, but very high loads and/or high speeds will accelerate nut wear. We recommend the following maximum linear traversing speeds for optimum life:

um traverse speed
100 mm/sec
250 mm/sec
760 mm/sec

#### 6. Critical Speed

This is the rotational speed at which a leadscrew will experience vibration or other dynamic problems. See the critical speed chart below to determine if the application parameters result in speeds approaching critical.

To minimise critical speed problems use a longer lead, choose a larger diameter screw or increase the bearing mount support.

#### 7. Maximum Load

Although the leadscrew assemblies are able to withstand relatively high loads without catastrophic failure, these units have been designed to operate with the loads shown on the product pages.

#### 8. Efficiency

The efficiency of a leadscrew varies with the lead angle of the screw. The theoretical maximum efficiencies of all our leadscrews are given in the part number tables on the product pages. These have been calculated using the static coefficient of friction 0.08. For applications where the dynamic efficiency is critical please contact Reliance Technical Sales.

#### 9. Leadscrew Inertia

Values of leadscrew inertia are given in the Typical Mechanical Properties chart on the next page.

#### 10. Screw Straightness

Typical screw straightness is 0.25 mm/metre.

#### 11. Leadscrew Interfacing

Examples of machined end options can be found on pages 7-27 to 7-35.

## Leadscrew and Nut Assemblies

+ Life will vary with loading, operating environment and duty cycle. Longer screw leads generally give longer life.

#### TFe CoATed LeAdSCReW ASSeMBLIeS

The TFE coating is designed to supply a more even distribution of lubricant than is normally achieved when using standard self lubricating plastics on steel. The entire screw surface is coated which gives an extremely even lubrication distribution and an expected increase in normal nut life of up to 300%. Lubrication to the screw/nut interface occurs by the nut picking up TFE particles from the coating as well as from migration of the internal lubricant from within the plastic nut.

Although care should be taken to ensure that chips and voids do not occur in the coating, small voids have been shown to have little effect on the system performance. The lubricant, although solid, has some of the "spreading" ability of fluid lubricants. When machining for bearing ends, soft fixtures are recommended.

TFE coated screws provide the maximum level of self-lubrication and should not be additionally lubricated or used in environments where oils or other lubricant contamination is possible.

## Couplings

#### ToRSIoNAL STIFFNeSS

This is the characteristic that describes the angular deflection when a torque is applied. High torsional stiffness contributes to increased accuracy and system response. It is essential for accurate feedback applications.

Applications that are subject to shock loads may require a less stiff coupling to reduce the peak torques and avoid premature failure or slipping clamps.

#### **RAdIAL CoMPLIANCe**

This is the characteristic that describes the force the coupling applies on the support bearings when the shafts are misaligned. High radial compliance is essential to provide low bearing loads.

#### **ToRQue CAPACITy**

In general, the rated torque figures are based on >10<sup>6</sup> torque reversals and the peak torque should not be applied for more than 1% of the duty cycle.

#### SHAFT MISALIGNMeNT

The most common type of misalignment is a combination of angular, parallel and axial misalignment and occurs due to the build-up of tolerances as associated parts are assembled together. As these accumulate randomly, worst-case misalignment should be calculated and used to select the correct coupling to avoid premature failure.

Torsional Error (minutes of arc) 20 n 500 1000 1500 2000 Torque (mNm) Test samples are standard products with a nominal O.D of 20 mm 8 7 6 Force (N) 5 4 3 2

140

120

100

80

60

40

Parallel Offset (mm)

#### TRANSMISSION eRRoR

Often referred to as kinematic error, this is the total error in the driven shaft position with regard to the driving shaft position. In a system the following factors must be individually considered to determine their overall effect.

- a. Backlash ..... internal clearance related
- b. Torsional wind up ..... torsional stiffness related
- c. Velocity error ..... coupling design related

#### a. Backlash

Is the amount of free rotational movement inherent in the coupling under zero or near zero torsional loads. Only the Oldham coupling type in this catalogue is susceptible to slight backlash.

#### b. Torsional Wind Up

In applications where the resistance is frictional, the driven shaft will experience a position lag, which will double with direction reversal, proportional to the torsional stiffness.

During operating mode, the inertia and the torque will cause a momentary lag but this will not be seen at standstill.

#### c. Velocity Error

In general, couplings with double flexing elements (Reli-a-Flex<sup>®</sup>, Bellows and Twin disc couplings) will introduce negligible velocity errors.

Velocity errors occur with angular misalignment and are proportional to shaft angle. Only the Oldham coupling type in this catalogue is susceptible to this error.

#### LuBRICATIoN

This is not required on any of the couplings in this catalogue.

#### **FLoATING SHAFTS**

We do not recommend the use of couplings in this catalogue for floating shafts, where one or both ends of a shaft are supported by a coupling.

## Couplings

**Technical** Information

#### **ToRSIoNAL ReSoNANCe**

The torsional natural frequencies of a system are dependent on the mass/elastic characteristics of the various inertias and connecting shafts. Torsional resonance can occur under certain conditions when the natural frequency of the system is close to the excitation frequency of the driving system. It is most likely to occur when the load is predominantly inertial and can occur in closed loop position or velocity control systems, leading to torsional vibrations which in severe circumstances can destroy the coupling.

Choosing a coupling that operates well above or well below the operating frequencies can help to avoid premature failure.

The resonant frequency of a system can be calculated from the following:

$$F_{R} = 1/2\pi \times \sqrt{(1/J_{M} + 1/J_{L}) \times 10.8/\pi \times C_{T}}$$

where

- $F_{R}$  = Resonant frequency (Hz)
- $J_{M}$  = Motor inertia (Kgm<sup>2</sup>)
- $J_{L}$  = Load inertia (Kgm<sup>2</sup>)
- $\tilde{C_{\tau}}$  = Coupling torsional stiffness (mNm/min)

#### **ReLI-A-FLex ® INSTALLATION**

Couplings are available with either clamp or set screw mounting. Clamp fastening, both Reli-a-Grip<sup>™</sup> and traditional, allows repeated repositioning of the coupling on the shaft leaving the shaft unmarked. The effectiveness of the clamp is dependent on the diameter being a 'close' fit in the coupling bore. Use of Reliance components will ensure that the clamp works correctly.

Set screws provide an effective but non-adjustable means of connecting couplings and shafts. Ideally the shafts should have a small flat in the area of the screw, which allows the set screw to seat below the surface of the shaft.

#### oLdHAM CouPLING, SoLId CouPLING ANd CoLLAR INSTALLATION

#### **Oldham Couplings**

Ensure that the misalignment between shafts is within the coupling's ratings. Slide a hub onto each shaft to be joined with the drive tenons facing each other. Rotate the hubs on the shaft so the drive tenons are located 90° from each other. Place a torque disc so one groove fits over the drive tenons of a hub and centre the disc by hand.

Insert a shim with the thickness of the coupling's axial motion rating into the groove of the torque disc. Slide the tenons of the second hub into the mating groove in the disc until it touches the shim stock.

Fully tighten the screw(s) on each hub to their recommended seating torque. Remove the shim stock to leave a small gap between the top of the drive tenons and the torque disc to allow for axial movement.

#### Solid Couplings

Align the coupling on the two shafts to be connected. Tighten the Nypatch<sup>®</sup> clamp screws in two stages. Starting with the inside screws, tighten to half of the recommended seating torque. Repeat for the outside screws, again tightening to half of the recommended seating torque (on two-piece collars be sure to maintain the gap between the two halves of the coupling during installation). Tighten screws to the full recommended seating torque following the same pattern, beginning with the inside screws.

#### Collars

Use collars as they are received.

Wipe the bore clean and apply a thin coat of light oil to the shaft. Place collar in desired location on shaft and tighten the collar until a slight resistance is felt (on two-piece collars be sure to maintain the gap between the two halves of the collar during installation). Bring collar into final position and tighten screws to the full recommended seating torque.

**Technical** Information

#### **FeATuReS**

The Reliance range of precision slides includes both ball and crossed roller units. Load capacities from 1.5 to 12580 N are available. Ballslides are available in both stainless steel and aluminium. Crossed roller slides are available in aluminium only.

These units offer the designer:

- Pre-assembled units allowing quick and simple assembly.
- Factory set preload to prevent side play and backlash and to control friction.
- · Low particle production for use in clean/medical environments.
- Low inertia and light weight allowing low powered rapid traverse.
- · High straight line accuracy of 0.0001 mm per mm travel.

#### 1 Ballslides

Manufactured from aluminium, these slide units offer ultra low friction, high load capacity and long life. The base and slide are ready machined for mounting. Modifications may be made to suit special requirements. Complete special slides can also be supplied. Please contact us.

#### 2 Crossed Roller Slides

When compared to ballslides these units offer equal size but higher load capacity and accuracy. They are also able to operate with high cycling rates and higher shock or cantilevered loads.

#### 3 Rack Driven Ball Slides

The addition of a small high precision rack along the side of a ballslide offers the option either to drive, measure position, or both, at very high speeds and loads.

#### eNGINeeRING dATA

For the highest accuracy, the load should be centred over the table or bed, allowing enough additional length to avoid reaching the maximum stroke length. To achieve the expected accuracy and life, the mating surfaces used to mount the slide should be flat. In extreme circumstances 'potting' of the base may be required.

Please refer to the product dimensions when selecting the fixings to avoid contact between screws and moving slide sections.

#### 1. Vertical Applications

When using ball or crossed roller type slides in vertical applications, the position and manner of the load, and the effects of gravity should be given extra consideration. Limiting the travel with positive stops also extends life instead of relying on the ball or roller retainer to act as a stop.

#### 2. Service Life

The theoretical service life of a slide based on  $L_{10}$  life is as follows:

Ballslides

Crossed roller slides  $L_{10} = (C/P)^{10/3} \times 50 \times 10^3$ 

 $L_{10} = (C/P)^3 \times 50 \times 10^3$ 

Where ·

L<sub>10</sub> = Life at 90% reliability (m)

= Dynamic load rating (N)

P = Calculated load (N)

#### 3. Lubrication

All types of slides can use similar lubricants but require them under different conditions.

Recommended L	ubricants
---------------	-----------

General Application High quality turbine oil Lithium soap based grease (NLGI No. 2)

Clean Environments Kluber Isoflex Topas NCA 52

#### 4. Temperature Limits

The maximum temperature is limited to 65°C (150°F) by the rolling element retainers. High temperature retainers can be supplied to operate up to 100°C (212°F) and although the slides can operate at higher temperatures this will reduce their life. Please contact us for further details.

#### MINIATuRe STRoKe SLIdeS

1. Rating Life Calculation and Short Stroke Factor Diagram

#### 2. Rating Life L

The rating life of the RST miniature stroke slide series can be calculated by using the formulae above, in accordance with ISO 14728-1.

#### 3. Lubrication

The lubrication of the RST miniature stroke slide series can be fullfilled by directly adding the lubricant onto the raceway of the rail.

#### MINIATuRe LINeAR GuideS

#### 1. Rail Butt-Jointing

When a longer rail is required than the maximum standard length available, two or more rails can be butt-jointed to create the desired length. When ordering add a -J to the end of the part number.

To ensure that the rails are mounted in an accurate and consistent manner they will be marked up as a matching pair when manufactured. The marking system for a rail that has has been ordered as a -J to be butt-jointed is shown below, where matching pairs have the same marking.

#### 2. Accuracy

Miniature Linear Guides are available in three accuracy grades P, H and N.

Accuracy classes (µm)		Precision <b>P</b>	High <b>H</b>	Normal <b>N</b>
Tolerance of dimension height H	н	± 10	± 20	± 40
Variation of height for different runner block on the same position of rail	∆H	7	15	25
Tolerance of dimension width W	W <sub>2</sub>	± 15	± 25	± 40
Variation of width for different runner block on the same position of rail	$\triangle W_2$	10	20	30

### Technical Information

### Linear Guides and Slides

#### 3. Speed

For the SS/ZZ variant:

Maximum speed: Vmax = 3 m/s

Maximum acceleration: Amax = 250 m/s2

(If preload V0, maximum acceleration is 40 m/s2)

#### For the EE/EU/UZ variant:

Maximum speed: Vmax = >5 m/s

Maximum acceleration: amax = 300 m/s2

(If preload V0, maximum acceleration is 60 m/s2)

#### 4. Pre-load

Miniature Linear Guides are available in three different grades of pre-load V0, VS and V1. The amount of pre-load can enhance stiffness, precision and torsional resistance but affects life and friction.

Pre-load	Model			Application				
Туре	Code	3	5	7	9	12	15	Application
Clearance	V0	+3 to 0	+3 to 0	+4 to 0	+4 to 0	+5 to 0	+6 to 0	Very smooth
Standard	VS	+1 to 0	+1 to 0	+2 to 0	+2 to 0	+2 to 0	+3 to 0	Smooth Precision
Light Pre-load	V1	0 to -0.5	0 to -1	0 to -3	0 to -4	0 to -5	0 to -6	High rigidity Minimal vibration High precision Load balance

#### 5. Operating Temperature

Miniature Linear Guides can operate in temperatures ranging from -40 $^{\circ}$ C to +80 $^{\circ}$ C. Temperatures of 100 $^{\circ}$ C can be reached for short term operation.

#### **INTRoduCTIoN**

Timing belts are endless toothed belt systems available in 2.5 mm and 5 mm pitch; intended for applications requiring a level of power transmission.

#### eNGINeeRING dATA

#### 1. Belt and Chain Length

Knowing the centre distance, the belt length can be calculated from the following:

For ratios = 1:1  $L_B = Z_1 \times t + 2a$ [mm]

 $L_{B} \approx \frac{t}{2} (Z_{2} + Z_{1}) + 2a + \frac{1}{4a} \left[ \frac{(Z_{2} - Z_{1})t}{\pi} \right]^{2}$ For ratios #1:1

[mm]

(approximate formula)

а	=	Centre distance	
	_	Dalt law with	

- Belt length LB

- Ζı = No of teeth, small pulley
- Z<sub>B</sub> No of teeth in belt =

- = Belt pitch
- = Pitch circle diameter large pulley
- No of teeth, large pulley =
- No of teeth in mesh =

t

 $d_2$ 

 $Z_2$ 

Ze

(a

#### 2. Centre Distance Calculation

Knowing the belt length, the centre distance can be calculated from the following;

For ratios = 1:1  

$$a = \frac{(Z_B - Z_1)t}{2} \quad [mm]$$
For ratios = 1:1  
pproximate formula)  

$$a \approx \frac{L_B - \frac{\pi}{2} \times (d_2 + d_1)}{4} + \sqrt{\left(\frac{L_B - \frac{\pi}{2} \times (d_2 + d_1)}{4}\right)^2 - \frac{(d_2 - d_1)^2}{8}} \quad [mm]$$

$$d_1 = \frac{Z_1 \times t}{\pi} \quad [mm] \quad d_2 = \frac{Z_2 \times t}{\pi} \quad [mm]$$

#### 3. Design Guidelines

Timing belt efficiency ranges from 95 to 98%, better than flat vee belts which rely on friction to transmit power. The 2.5 mm and 5 mm pitch timing belts are manufactured in wear resistant polyurethane with high grade steel wire tension members, therefore any elongation due to load and pre-tension will follow Hookes' law. The manufacturing process for these timing belts produces the 'classical' trapeziodal tooth form to close tolerances. This ensures an even distribution of load during use and the transmission of high torques. These belts are suitable for indexing, positioning and conveying drives.

It is possible to design drives with fixed centres but generally the drive centres should be adjustable or have idler pulleys. This is particularly important in multi-shaft or high power drives. The idler pulleys should be fitted to the slack side of the drive and must not be spring loaded. Timing belt drives do not require as much tension as other belt drives which depend on friction to transmit load. The belt should be installed with a snug fit, neither taut nor loose. As a general guide the correct level of tension can be determined by measuring the force necessary to deflect the belt an amount equal to 1/64th of the span centres "a". Values for the measuring force recorded on a spring balance applied mid-span should be within 20% of the values shown below.

2.5 mm - 0.07kg 5 mm - 0.30kg

The belts must be rigidly mounted. Variation in centre distance can lead to premature wear. The belt and pulley system must be assembled loose to prevent over stretching. The belts are guided on the pulleys by flanges. One pulley should be flanged on both sides, or two alternative flanges provided, one on each pulley. For drives with vertical shafts, both pulleys should be flanged on both sides.

For a belt to transmit full power, a minimum of 6 teeth must be in mesh on each pulley. The number of teeth in mesh can be determined from the following formula:

$$Ze = \frac{Z_1}{180} * \arccos \frac{(Z_2 - Z_1) \times t}{2 \pi a}$$
Number of teeth in mesh  
calculation is always based  
on the smallest pulley.

To minimise belt fatigue, pulleys with a minimum of 20 teeth are recommended. As a general guide larger pulleys reduce the amount of belt flexing and therefore improve belt life.

T10-2

Technical Information

#### **SPeCIFICATIoN**

The first step in choosing the correct bearing for an application is to determine the forces which it will support in service. The forces will depend on the exact configuration of the system and will probably include some, or all, of the following:

- · The weight of the shaft, including gears and other shaft attachments.
- · Gear mesh reaction forces, due to torque transmission (see below).
- · Gear separation due to anti-backlash forces.
- Forces due to belt or pulley tensions.
- · Axial pre-load forces.

#### GeAR MeSH ReACTIONS

In order to calculate the loads which will be applied to the bearings in the simply supported spur gear pass arrangement shown on the next page, it is first necessary to calculate the forces at the gear mesh.

The tangential force at the gear mesh can be calculated from the following equation:

$$W_t = T/r$$
 where T = Torque  
and r = Radius

and the separating force at the gear mesh can be calculated from:

$W_r' = W_t tan \phi_t$	where $\boldsymbol{\varphi}_t$	<ul> <li>transverse pressure angle</li> <li>normal pressure angle for spur gears</li> <li>20° for our standard gears</li> </ul>
$W_{r}' = 0.364W_{t}$		(for 20° pressure angle spur gear)

If required, the total radial load at the gear mesh can be calculated from the final equation:

$$W_r = (W_t)^2 + (W_r')^2$$

**Bearing loads** 

Position	Forces At These Positions					
1 Usition	Tangential Force	Separating Force	Total Radial Load			
Gear Mesh	vų	vŗ	vķ			
Bearing A	$W_n = \frac{W_n a}{a+b}$	$W_{r2} = \frac{W_r^* a}{a + b}$	$W_{rA} = \sqrt{(W_{rA})^2 + (W_{r2})^2}$			
Bearing B	$W_{ra} = \frac{W_{b}}{a+b}$	$W_{ra} = \frac{W_r'b}{a+b}$	$W_{re} = \sqrt{(W_{r3})^2 + (W_{r4})^2}$			
Bearing C	$W_{rs} = \frac{W_{rc}}{c+d}$	$W_{rs} = \frac{W_{r}'c}{c+d}$	$W_{rc} = \sqrt{(W_{rg})^2 + (W_{rg})^2}$			
Bearing D	$W_{rr} = \frac{W_{r}d}{c+d}$	$W_{rs} = \frac{W_r'd}{c+d}$	$W_{ro} = \sqrt{(W_{rr})^2 + (W_{ra})^2}$			

For bearing life calculations based on these radial loads see page T12-3.

Note - These equations can only be used for spur gear calculations, because they are not affected by self-generated axial forces.

### **Bearings and Spacers**

#### FoRCe SHARING

To determine how the forces are shared between a pair of bearings, use the equations below for these two most frequently occurring configurations:

The individual bearing loads can then be used to predict the bearing life.

#### **BeARING LIFe**

The life of a bearing is defined as the length of time a bearing will operate satisfactorily in the application at its operating speed under applied load. Life predictions depend on a careful definition of failure criteria and consideration of operating environment, mounting practice, lubrication, operating speed and loading. As a guide, the relationship between actual applied load and bearing fatigue life is given below:

- L<sub>H</sub> = Rated life in hours
- N = Speed in rpm
- P = Bearing load (e.g. N)
- C = Bearing capacity (e.g. N)

#### INSTALLATION ANd HouSING CoNSIdeRA TIONS

The installation of a bearing will usually be determined by how it fits with its mating components. Interference or transition fits provide the most positive location of the bearing, however, they will require pressing during installation. Clearance fits allow the bearing to be assembled very easily, but could potentially lead to problems depending on the operating conditions. If a press fit is required, it is essential that no appreciable force is transferred through the rolling elements of the bearing during installation.

Special care must be taken when using bearings in aluminium housings, especially when wide temperature variations are expected. It is possible for the contraction of the housing to squash the bearing raceway and remove the radial clearance required for the bearing to operate.

Potential problems with clearance fits:

Fretting - Wearing away of the surface due to rubbing of the components. Accuracy - Accuracy can be compromised due to unpredictable movement.

Potential problems with interference fits:

Assembly - Can be difficult or impossible without damaging the bearing. Radial clearance - Can be reduced if the interference is too great.

#### ISo MeTRIC SCReW THReAdS: LIMITS ANd ToLeRANCeS

Reference: BS3643 Pt 2, 2007.

#### ToRQue ANd TeNSIoN GuideLINeS

The usual method for specifying and measuring fastener installation is tightening torque, as this is relatively easy to measure with a torque wrench. Unfortunately, a torque wrench does not give an accurate indication of bolt tension because it does not take friction into account. The friction is dependent on the bolt, nut and washer materials, surface smoothness, machining accuracy, degree of lubrication (including uncured retaining products) and the number of times a fastener has been installed. The torque values provided for the screws in the table below are, therefore, to be used only as a guide, the friction factors mentioned should be considered for each application.

Aluminium structural components assumed, as this is typical of the applications for which the Reliance standard products range is designed for.

Screw Size	I for 700 MPa Socket   for Stainless St			
M1.6	0.13	0.05		
M2	0.26	0.05		
M2.5	0.52	0.18		
M3	0.92	0.32		
M4	2.10	0.75		
M5	4.20	1.50		

#### **ReLIANCe STANdARd MATeRIALS**

Reliance Precision screws are manufactured from the materials listed below. Where the product material is specified, we reserve the right to change the actual material to an equivalent specification without notice depending on availability.

Material Grade	Treatment	Grain Structure	Tensile Strength MPa (min)	Corrosion Resistance
A2-70	n/a	Austenitic	700	Excellent
A4-70	n/a	Austenitic	700	Excellent
303	n/a	Austenitic	585	Excellent
416	Hardened to 26/32 HRc	Martensitic	880	Good

#### General Properties of Austenitic Stainless Steels

- · Excellent resistance to oxidation and corrosion.
- Essentially non-magnetic.
- · Cannot be hardened by heat-treatment.
- · Work hardened very easily.
- Relatively high coefficient of thermal expansion of 18 microns/metre/°C, close to that of aluminium.

#### General Properties of Martensitic Stainless Steels

- · Good resistance to oxidation and corrosion.
- · Magnetic.
- Readily heat treatable to high strength condition.
- Potential for tensile strengths > 1200 MPa.
- · Coefficient of thermal expansion of approximately 11 microns/metre/°C.

### **Location Map**

**NoRTH & SouTH APPRoACHeS** 

**From the North:** Junction 39 of M1 (Denby Dale turn off), follow the A636 for 3 miles and then turn right on to the A637 for 2 miles. At the next roundabout turn left on to the A642 to Huddersfield. After 1 mile on the A642 turn left through the village of Lepton, to join the A629. Turn left and Reliance is 100 yards on the left.

**From the South:** Juntion 38 of the M1, follow the A637 for 4.5 miles passing Yorkshire Sculpture Park and straight accross at the second roundabout on to the A642 to Huddersfield.

or

Junction 35A M1, follow the A616 for 3 miles, turn off onto the A629 towards Huddersfield. Follow this road for approximately 15 miles, passing through Thurgoland, Ingbirchworth and Shepley. Reliance is on the right.

### eAST & WeST APPRoACHeS

**From the east:** Junction 25 of M62, follow the A644 for 2 miles and turn right at the next roundabout on to the A62. Follow the A62 for 5 miles until it joins the Huddersfield ring road. Leave the ring road following the A629 for Sheffield (Sainburys supermarket on your left). Follow the A629 for 3.4 miles. Reliance is on the left.

**From the West:** Junction 23 of the M62 (or J25 and follow as above), follow the A640 for 3 miles to Huddersfield ring road. Turn right on to the ring road. Follow the ring road for approximately 3/4 miles ignoring the signs for Sheffield (A616) and Manchester (A62) until you pass the University. Turn right at the next roundabout onto the A629, sign posted to Sheffield and Wakefield. Follow the A629 for 3.4 miles. Reliance is on the left.

Appendices and Index

### **Conditions of Sale**

In addition to these conditions of sale, our standard Conditions of Sale also apply. A copy of these is available on request and from our website www.reliance.co.uk/en/help

Minimum order charge - Orders are subject to a minimum order charge of £250.00.

Carriage and packing - Additional charges are made for carriage and packing.

**Payment** - Payment terms are 30 days. New customers are requested to complete an application form for a credit account. Customers who do not have a credit account with Reliance are requested to supply cheque with order. In addition, orders may be paid for by Visa and Mastercard.

**Telephone orders** - An order number must be quoted by the customer. We reserve the right to supply parts against a telephone order. All telephone orders are accepted subject to these conditions of sale and those detailed on the acknowledgement of order. An acknowledgement will normally be sent by Reliance and goods will be supplied in accordance with the order acknowledgement.

**Certificates of Conformance** - Reliance's quality management system is certified to AS9100 and ISO 9001. A Certificate of Conformance can be supplied at an additional charge of £10.00 per delivery. Alternatively, a Certificate with full material traceability can be supplied at a charge of £20.00 per delivery.

**Confirmation** - All orders, other than telephone orders with a value of less than £500 and orders placed through our website, are subject to acceptance in writing by Reliance Precision Limited.

**order amendments** - Order amendments are subject to our approval and a charge will be made for reasonable compensation for any costs incurred.

**Returns** - Unused items may, solely at our discretion, be accepted for credit within 90 days of delivery. Any parts so accepted will be subject to a 20% service charge for re-inspection and handling. No credit can be allowed after the above period, or for any used or modified part, or for parts manufactured to a customer's specification.

Additional charges - Reliance reserves the right to charge for all additional expenses and taxes incurred over and above published prices (including without limitation duty, VAT, exchange rate fluctuations etc.)

**Alterations** - As a result of continuous product development, Reliance reserves the right to alter prices and other details without prior notice and to change dimensions where this does not affect the function of the item.

Product overview - Bevel gearboxes Product overview - Brass gears	3-14 4-70
Product overview - Couplings and collars	8-2 to 8-7
Product overview - Custom gearboxes	3-28
Product overview - Epicyclic gearboxes	3-24
Product overview - Ground spur gears	4-60
Product overview - Hybrid linear actuators	2-24
Product overview - Leadscrew and nut assemblies	7-2 to 7-6
Product overview - Leadscrew assemblies	7-36
Product overview - Linear guides and slides	9-2
Product overview - Linear rail actuator	2-26
Product overview - Motorised leadscrew linear slide	2-28
Product overview - Planetary gearboxes	3-3 4 2 to 4 5
Product overview - Precision gears	4-2 to 4-5
